# ICSE QUESTION PAPER <br> Class X Maths <br> (2016) Solution 

## SECTION A

1. (a) Let $f(x)=2 x^{3}+3 x^{2}-k x+5$

Using remainder theorem,
$\mathrm{f}(2)=7$
$\therefore 2(2)^{3}+3(2)^{2}-\mathrm{k}(2)+5=7$
$\therefore 2(8)+3(4)-\mathrm{k}(2)+5=7$
$\therefore 16+12-2 \mathrm{k}+5=7$
$\therefore 2 \mathrm{k}=16+12+5-7$
$\therefore 2 \mathrm{k}=26$
$\therefore \mathrm{k}=13$
(b) $\mathrm{A}^{2}=9 \mathrm{~A}+\mathrm{MI}$
$\Rightarrow A^{2}-9 A=m I$
$\mathrm{A}^{2}=\mathrm{AA}$
$=\left[\begin{array}{cc}2 & 0 \\ -1 & 7\end{array}\right]\left[\begin{array}{cc}2 & 0 \\ -1 & 7\end{array}\right]$
$=\left[\begin{array}{cc}4 & 0 \\ -9 & 49\end{array}\right]$
Substitute $A^{2}$ in (1)
$\mathrm{A}^{2}-9 \mathrm{~A}=\mathrm{mI}$
$\Rightarrow\left[\begin{array}{cc}4 & 0 \\ -9 & 49\end{array}\right]-9\left[\begin{array}{cc}2 & 0 \\ -1 & 7\end{array}\right]=m\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right]$
$\Rightarrow\left[\begin{array}{cc}4 & 0 \\ -9 & 49\end{array}\right]-\left[\begin{array}{cc}18 & 0 \\ -9 & 63\end{array}\right]=\left[\begin{array}{cc}\mathrm{m} & 0 \\ 0 & \mathrm{~m}\end{array}\right]$
$\Rightarrow\left[\begin{array}{cc}-14 & 0 \\ 0 & -14\end{array}\right]=\left[\begin{array}{cc}\mathrm{m} & 0 \\ 0 & \mathrm{~m}\end{array}\right]$
$\Rightarrow \mathrm{m}=-14$
(c) Mean $=\frac{\text { Sum of all observations }}{\text { Total number of observations }}$
$\therefore 68=\frac{45+52+60+\mathrm{x}+69+70+26+81+94}{9}$
$\Rightarrow 68=\frac{497+x}{9}$
$\Rightarrow 612=497+\mathrm{x}$
$\Rightarrow \mathrm{x}=612-497$
$\Rightarrow \mathrm{x}=115$

Data in ascending order
$26,45,52,60,69,70,81,94,115$
Since the number of observations is odd, the median is the $\left(\frac{\mathrm{n}+1}{2}\right)^{\text {th }}$ observation
$\Rightarrow$ Median $=\left(\frac{9+1}{2}\right)^{\text {th }}$ observation $=5^{\text {th }}$ observation
Hence, the median is 69.
2. (a) (i) Slope of $P Q=\frac{3-k}{1-3 k-6}$

$$
\begin{aligned}
& \Rightarrow \frac{1}{2}=\frac{3-\mathrm{k}}{-3 \mathrm{k}-5} \\
& \Rightarrow-3 \mathrm{k}-5=2(3-\mathrm{k}) \\
& \Rightarrow-3 \mathrm{k}-5=6-2 \mathrm{k} \\
& \Rightarrow \mathrm{k}=-11
\end{aligned}
$$

(ii)Substituting $k$ in $P$ and $Q$, we get

$$
\begin{aligned}
& \mathrm{P}(6, \mathrm{k})=\mathrm{P}(6,-11) \text { and } \mathrm{Q}(1-3 \mathrm{k}, 3)=\mathrm{Q}(34,3) \\
& \therefore \text { Midpoint of } \mathrm{PQ}=\left(\frac{6+34}{2}, \frac{-11+3}{2}\right)=\left(\frac{40}{2}, \frac{-8}{2}\right)=(20,-4)
\end{aligned}
$$

(b) $\operatorname{cosec} 27^{\circ}-\tan ^{2} 33^{\circ}+\cos 44^{\circ} \operatorname{cosec} 46^{\circ}-\sqrt{2} \cos 45^{\circ}-\tan ^{2} 60^{\circ}$

$$
\begin{aligned}
& =\operatorname{cosec}^{2}\left(90^{\circ}-33^{\circ}\right)^{\circ}-\tan ^{2} 33^{\circ}+\cos 44^{\circ} \operatorname{cosec}\left(90^{\circ}-44^{\circ}\right)-\sqrt{2} \cos 45^{\circ}-\tan ^{2} 60^{\circ} \\
& =\sec ^{2} 33^{\circ}-\tan ^{2} 33^{\circ}+\cos 44^{\circ} \sec 44^{\circ}-\sqrt{2} \cos 45^{\circ}-\tan ^{2} 60 \\
& =1+1-\sqrt{2} \cos 45^{\circ}-\tan ^{2} 60 \\
& =1+1-\sqrt{2}\left(\frac{1}{\sqrt{2}}\right)-(\sqrt{3})^{2} \\
& =2-1-3 \\
& =-2
\end{aligned}
$$

(c) Let the number of cones be $n$.

Let the radius of sphere ber $r_{s}=6 \mathrm{~cm}$
Radius of a cone be $r_{c}=2 \mathrm{~cm}$
And height of the cone be $=3 \mathrm{~cm}$
Volume of sphere $=n($ Volume of a metallic cone)
$\Rightarrow \frac{4}{3} \pi r_{s}^{3}=n\left(\frac{1}{3} \pi r_{c}^{2} h\right)$
$\Rightarrow \frac{4}{\not Z} \pi r_{s}^{3}=n\left(\frac{1}{\not Z} \pi r_{c}^{2} h\right)$
$\Rightarrow \frac{4 r_{s}^{3}}{r_{c}^{2} h}=n$
$\Rightarrow \mathrm{n}=\frac{4(6)^{3}}{(2)^{2}(3)}$
$\Rightarrow \mathrm{n}=\frac{4 \times 216}{4 \times 3}$
$\Rightarrow \mathrm{n}=72$
Hence, the number of cones is 72 .
3. (a) $-3(x-7) \geq 15-7 x>\frac{x+1}{3}$
$\Rightarrow-3(x-7) \geq 15-7 x$ and $15-7 x>\frac{x+1}{3}$
$\Rightarrow-3 \mathrm{x}+21 \geq 15-7 \mathrm{x}$ and $45-21 \mathrm{x}>\mathrm{x}+1$
$\Rightarrow-3 \mathrm{x}+7 \mathrm{x} \geq 15-21$ and $45-1>\mathrm{x}+21 \mathrm{x}$
$\Rightarrow 4 \mathrm{x} \geq-6$ and $44>22 \mathrm{x}$
$\Rightarrow \mathrm{x} \geq \frac{-3}{2}$ and $2>\mathrm{x}$
$\Rightarrow x \geq-1.5$ and $2>x$
The solution set is $\{x: x \in R,-1.5 \leq x<2\}$.

(b) (i) AD is parallel to BC , i.e., OD is parallel to BC and BD is transversal.
$\Rightarrow \angle \mathrm{ODB}=\angle \mathrm{CBD}=32^{\circ} \quad \ldots .($ Alternate angles $)$
In $\triangle O B D$,
$\mathrm{OD}=\mathrm{OB} \quad$....(Radii of the same circle)
$\Rightarrow \angle \mathrm{ODB}=\angle \mathrm{OBD}=32^{\circ}$
(ii) AD is parallel to BC , i.e., AO is parallel to BC and $O B$ is transversal.
$\Rightarrow \angle \mathrm{AOB}=\angle \mathrm{OBC} \quad \ldots .$. (Alternate angles)
$\Rightarrow \angle \mathrm{OBC}=\angle \mathrm{OBD}+\angle \mathrm{DBC}$
$\Rightarrow \angle \mathrm{OBC}=32^{\circ}+32^{\circ}$
$\Rightarrow \angle \mathrm{OBC}=64^{\circ}$
$\Rightarrow \angle \mathrm{AOB}=64^{\circ}$
(iii) In $\triangle O A B$,

$$
\begin{aligned}
& \mathrm{OA}=\mathrm{OB} \quad \ldots .(\text { Radii of the same circle) } \\
& \Rightarrow \angle \mathrm{OAB}=\angle \mathrm{OBA}=\mathrm{x} \text { (say) } \\
& \angle \mathrm{OAB}+\angle \mathrm{OBA}+\angle \mathrm{AOB}=180^{\circ} \\
& \Rightarrow \mathrm{x}+\mathrm{x}+64^{\circ}=180^{\circ} \\
& \Rightarrow 2 \mathrm{x}=180^{\circ}-64^{\circ} \\
& \Rightarrow 2 \mathrm{x}=116^{\circ} \\
& \Rightarrow \mathrm{x}=58^{\circ} \\
& \Rightarrow \angle \mathrm{OAB}=58^{\circ} \\
& \text { i.e., } \angle \mathrm{DAB}=58^{\circ} \\
& \Rightarrow \angle \mathrm{DAB}=\angle \mathrm{BED}=58^{\circ} \quad \ldots . . \text { (Angles inscribed in the same arc are equal.) }
\end{aligned}
$$

(c) $\frac{3 a+2 b}{5 a+3 b}=\frac{18}{29}$

$$
\Rightarrow 29(3 a+2 b)=18(5 a+3 b)
$$

$$
\Rightarrow 87 \mathrm{a}+58 \mathrm{~b}=90 \mathrm{a}+54 \mathrm{~b}
$$

$$
\Rightarrow 58 \mathrm{~b}-54 \mathrm{~b}=90 \mathrm{a}-87 \mathrm{a}
$$

$$
\Rightarrow 4 \mathrm{~b}=3 \mathrm{a}
$$

$$
\Rightarrow \frac{\mathrm{a}}{\mathrm{~b}}=\frac{4}{3}
$$

4. (a) Total number of outcomes $=30$
(i) The perfect squares lying between 11 and 40 are 16,25 and 36 .

So the number of possible outcomes $=3$
$\therefore$ Probability that the number on the card drawn is a perfect square

$$
=\frac{\text { Number of possible outcomes }}{\text { Total number of outcomes }}=\frac{3}{30}=\frac{1}{10}
$$

(ii) The numbers from 11 to 40 that are divisible by 7 are $14,21,28$ and 35 .

So the number of possible outcomes $=4$
Probability that the number on the card drawn is divisible by 7
$=\frac{\text { Number of possible outcomes }}{\text { Total number of outcomes }}=\frac{4}{30}=\frac{2}{15}$
(b) (i)

$A^{\prime}=(4,4)$ AND $B^{\prime}=(3,0)$
(ii) The figure is an arrow head.
(iii) The $y$-axis is the line of symmetry of figure OABCB'A'.
(c) (i) $\mathrm{P}=\mathrm{Rs} .5000, \mathrm{~T}=1$ year, $\mathrm{A}=\mathrm{Rs} .5325$
$I=A-P$
$\Rightarrow \mathrm{I}=5325-5000$
$\Rightarrow \mathrm{I}=325$
So, the interest at the end of first year is Rs. 325 .
$\mathrm{I}=\frac{\mathrm{PRT}}{100}$
$\Rightarrow \mathrm{R}=\frac{\mathrm{I} \times 100}{\mathrm{P} \times \mathrm{T}}$
$\Rightarrow \mathrm{R}=\frac{325 \times 100}{5000 \times 1}$
$\Rightarrow R=\frac{32500}{5000}=6.5 \%$
So,the rate of interest at the end of the first year is 6.5\%.
(ii) The amount at the end of the first year will be the principal for the second year.

$$
\begin{aligned}
& \mathrm{P}=\mathrm{Rs} .5325, \mathrm{~T}=1 \text { year, } \mathrm{R}=6.5 \% \\
& \mathrm{I}=\frac{\mathrm{PRT}}{100} \\
& \Rightarrow \mathrm{I}=\frac{5325 \times 6.5 \times 1}{100} \\
& \Rightarrow \mathrm{I}=346.125 \\
& \mathrm{~A}=\mathrm{P}+\mathrm{I} \\
& \Rightarrow \mathrm{~A}=5325+346.125 \\
& \Rightarrow \mathrm{~A}=5671.125 \\
& \Rightarrow \mathrm{~A} \approx \mathrm{Rs} .5671
\end{aligned}
$$

So,the amount at the end of the second year is Rs. 5671.

## SECTION B (40 Marks)

Attempt any four questions from this section
5. (a) $x^{2}-3(x+3)=0$
$\Rightarrow \mathrm{x}^{2}-3 \mathrm{x}-9=0$
Comparing with $\mathrm{ax}^{2}+\mathrm{bx}+\mathrm{c}$, we get
$a=1, b=-3, c=-9$
$\therefore \mathrm{x}=\frac{-\mathrm{b} \pm \sqrt{\mathrm{b}^{2}-4 \mathrm{ac}}}{2 \mathrm{a}}$
$\Rightarrow \mathrm{x}=\frac{-(-3) \pm \sqrt{(-3)^{2}-4(1)(-9)}}{2(1)}$
$\Rightarrow \mathrm{x}=\frac{3 \pm \sqrt{9+36}}{2}$
$\Rightarrow \mathrm{x}=\frac{3 \pm \sqrt{45}}{2}$
$\Rightarrow \mathrm{x}=\frac{3 \pm \sqrt{9 \times 5}}{2}$
$\Rightarrow \mathrm{x}=\frac{3 \pm 3 \sqrt{5}}{2}$
$\Rightarrow \mathrm{x}=\frac{3+3 \sqrt{5}}{2}$ or $\mathrm{x}=\frac{3-3 \sqrt{5}}{2}$
$\Rightarrow \mathrm{x}=\frac{3+3 \times 2.236}{2}$ or $\mathrm{x}=\frac{3-3 \times 2.236}{2}$
$\Rightarrow \mathrm{x}=\frac{3+6.708}{2}$ or $\mathrm{x}=\frac{3-6.708}{2}$
$\Rightarrow \mathrm{x}=\frac{9.708}{2}$ or $\mathrm{x}=\frac{-3.708}{2}$
$\Rightarrow \mathrm{x}=4.85$ or $\mathrm{x}=-1.85$
(b) Since the interest is earned on the minimum balance between $10^{\text {th }}$ day and the last day of the month as per entries, we have
Minimum balance for April = Rs. 8300
Minimum balance for May = Rs. 7600
Minimum balance for June = Rs. 10300
Minimum balance for July = Rs. 10300
Minimum balance for August = Rs. 3900
Minimum balance for September $=$ Rs. 0
Total balance = Rs. 40400
$\Rightarrow$ Total amount qualifying for interest $=$ Rs. 40400
$\Rightarrow$ Principle for 1 month $\left(\frac{1}{12}\right.$ year $)=$ Rs. 40400,
Rate of interest $=4.5 \%$ per annum

$$
\Rightarrow \text { Interest }=\text { Rs. } \frac{40400 \times 4.5 \times \frac{1}{12}}{100}=\text { Rs. } 151.50
$$

$$
\begin{aligned}
\text { Amount } & =\text { Balance in the account in last month }+ \text { Interest } \\
& =5900+151.5 \\
& =\text { Rs. } 6051.50
\end{aligned}
$$

Thus, Mrs. Ravi receives Rs. 6051.50 on closing the account.
(c) Given $\mathrm{P}=$ Rs. $1500, \mathrm{I}=496.50, \mathrm{R}=10 \%$

$$
\begin{aligned}
& A=P+I \\
& \Rightarrow A=\text { Rs. } 1500+\text { Rs. } 496.50=\text { Rs. } 1996.50 \\
& A=P\left(1+\frac{R}{100}\right)^{n} \\
& \Rightarrow 1996.50=1500\left(1+\frac{10}{100}\right)^{n} \\
& \Rightarrow \frac{1996.50}{1500}=\left(1+\frac{1}{10}\right)^{n} \\
& \Rightarrow 1.331=(1.1)^{n} \\
& \Rightarrow(1.1)^{3}=(1.1)^{n} \\
& \Rightarrow n=3
\end{aligned}
$$

6. (a) Steps of construction:
7. Draw AF measuring 5 cm using a ruler.
8. With A as the centre and radius equal to AF , draw an arc above AF .
9. With F as the centre, and same radius cut the previous arc at Z
10. With Z as the centre, and same radius draw a circle passing through A and F .
11. With A as the centre and same radius, draw an arc to cut the circle above AF at B .
12. With $B$ as the centre and same radius, draw ar arc to cut the circle at $C$.
13. Repeat this process to get remaining vertices of the hexagon at $D$ and $E$.
14. Join consecutive arcs on the circle to form the hexagon.
15. Draw the perpendicular bisectors of AF, FE and DE.
16. Extend the bisectors of $\mathrm{AF}, \mathrm{FE}$ and DE to meet $\mathrm{CD}, \mathrm{BC}$ and AB at $\mathrm{X}, \mathrm{L}$ and O respectively.
17. Join $\mathrm{AD}, \mathrm{CF}$ and EB.
18. These are the 6 lines of symmetry of the regular hexagon.

(b) (i) Since $\square P Q R S$ is a cyclic quadrilateral,
$\angle \mathrm{QRT}=\angle \mathrm{SPT} \quad \ldots .(1)$ (exterior angle is equal to interior opposite angle) In $\triangle T P S$ and $\triangle T R Q$,
$\angle \mathrm{PTS}=\angle \mathrm{RTQ} \ldots$. (commonangle)
$\angle \mathrm{QRT}=\angle \mathrm{SPT} \quad \ldots .($ from 1$)$
$\Rightarrow \Delta \mathrm{TPS} \sim \Delta \mathrm{TRQ} \quad \ldots$ (AA similarity criterion)
(ii) Since $\Delta T P S \sim \Delta T R Q$, implies that corresponding sides are proportional

$$
\begin{aligned}
& \text { i.e., } \frac{S P}{Q R}=\frac{T P}{T R} \\
& \Rightarrow \frac{S P}{4}=\frac{18}{6} \\
& \Rightarrow S P=\frac{18 \times 4}{6} \\
& \Rightarrow S P=12 \mathrm{~cm}
\end{aligned}
$$

(iii) Since $\triangle T P S \sim \triangle T R Q$,

$$
\begin{aligned}
& \frac{\operatorname{Ar}(\Delta \mathrm{TPS})}{\operatorname{Ar}(\Delta \mathrm{TRQ})}=\frac{\mathrm{SP}^{2}}{\mathrm{RQ}^{2}} \\
& \Rightarrow \frac{27}{\operatorname{Ar}(\Delta \mathrm{TRQ})}=\frac{12^{2}}{4^{2}} \\
& \Rightarrow \operatorname{Ar}(\Delta \mathrm{TRQ})=\frac{27 \times 4 \times 4}{12 \times 12} \\
& \Rightarrow \operatorname{Ar}(\Delta \mathrm{TRQ})=3 \mathrm{~cm}^{2}
\end{aligned}
$$

$$
\text { Now, } \operatorname{Ar}(\square \mathrm{PQRS})=\operatorname{Ar}(\Delta \mathrm{TPS})-\operatorname{Ar}(\Delta \mathrm{TRQ})=27-3=24 \mathrm{~cm}^{2}
$$

(c) $\mathrm{A}=\left[\begin{array}{cc}4 \sin 30^{\circ} & \cos 0^{\circ} \\ \cos 0^{\circ} & 4 \sin 30^{\circ}\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{l}4 \\ 5\end{array}\right]$
(i) Let the order of matrix $\mathrm{X}=\mathrm{m} \times \mathrm{n}$

Order of matrix $\mathrm{A}=2 \times 2$
Order of matrix $B=2 \times 1$
Now, $A X=B$

$\Rightarrow$ Order of matrix $\mathrm{X}=\mathrm{m} \times \mathrm{n}=2 \times 2$
(ii) Let the matrix $\mathrm{X}=\left\lfloor\begin{array}{l}\mathrm{x} \\ \mathrm{y}\end{array}\right\rfloor$

$$
\mathrm{AX}=\mathrm{B}
$$

$$
\Rightarrow\left[\begin{array}{cc}
4 \sin 30^{\circ} & \cos 0^{\circ} \\
\cos 0^{\circ} & 4 \sin 30^{\circ}
\end{array}\right]\left[\begin{array}{l}
x \\
y
\end{array}\right]=\left[\begin{array}{l}
4 \\
5
\end{array}\right]
$$

$$
\Rightarrow\left[\begin{array}{c}
4\left(\frac{1}{2}\right) \\
1 \\
1
\end{array} 4\left(\frac{1}{2}\right)\right]\left[\begin{array}{l}
\mathrm{x} \\
\mathrm{y}
\end{array}\right]=\left[\begin{array}{l}
4 \\
5
\end{array}\right]
$$

$$
\Rightarrow\left[\begin{array}{ll}
2 & 1 \\
1 & 2
\end{array}\right]\left[\begin{array}{l}
x \\
y
\end{array}\right]=\left[\begin{array}{l}
4 \\
5
\end{array}\right]
$$

$$
\Rightarrow\left[\begin{array}{c}
2 x+y \\
x+2 y
\end{array}\right]=\left[\begin{array}{l}
4 \\
5
\end{array}\right]
$$

$$
\Rightarrow 2 x+y=4 \ldots .(1)
$$

$$
x+2 y=5 \quad \ldots .(2)
$$

Multiplying (1) by 2 , we get
$4 x+2 y=8$
Subtracting (2) from (3), we have
$3 x=3$
$\Rightarrow \mathrm{x}=1$
Substitute $x$ in (1), we get
$2 \times 1+y=4$
$\Rightarrow \mathrm{y}=2$
Hence, the matrix $X=\left[\begin{array}{l}x \\ y\end{array}\right]=\left[\begin{array}{l}1 \\ 2\end{array}\right]$
7. (a)

A is the aeroplane, D and C are the ships sailing towards A.
Ships are sailing towards the aeroplane in the same direction. In the figure, height $\mathrm{AB}=1500 \mathrm{~m}$

To find: Distance between the ships, that is CD.

Solution:
In the right-angled $\triangle \mathrm{ABC}$,
$\tan 45^{\circ}=\frac{\mathrm{AB}}{\mathrm{BC}}$
$\Rightarrow 1=\frac{1500}{\mathrm{BC}}$
$\Rightarrow \mathrm{BC}=1500 \mathrm{~m}$

In the right-angled $\triangle \mathrm{ABD}$,
$\tan 30^{\circ}=\frac{\mathrm{AB}}{\mathrm{BD}}$
$\Rightarrow \frac{1}{\sqrt{3}}=\frac{1500}{B D}$
$\Rightarrow \mathrm{BD}=1500 \sqrt{3} \mathrm{~m}$
$\Rightarrow \mathrm{BD}=1500(1.732)=2598 \mathrm{~m}$
$\therefore$ Distance between the ships $=C D=B D-B C$

$$
\begin{aligned}
& =2598-1500 \\
& =1098 \mathrm{~m}
\end{aligned}
$$

(b)

| Scores | f | c.f. |
| :---: | :---: | :---: |
| $0-10$ | 9 | 9 |
| $10-20$ | 13 | 22 |
| $20-30$ | 20 | 42 |
| $30-40$ | 26 | 68 |
| $40-50$ | 30 | 98 |
| $50-60$ | 22 | 120 |
| $60-70$ | 15 | 135 |
| $70-80$ | 10 | 145 |
| $80-90$ | 8 | 153 |
| $90-100$ | 7 | 160 |
|  | $\mathrm{n}=160$ |  |

(i) Median $=\left(\frac{\mathrm{n}}{2}\right)^{\text {th }}$ term $=\left(\frac{160}{2}\right)^{\text {th }}$ term $=80^{\text {th }}$ term

Through mark 80 on $y$-axis, draw a horizontal line which meets theogive drawn at point Q .
Through Q, draw a vertical line which meets thex-axis at the mark of 43.
$\Rightarrow$ Median $=43$
(ii) Since the number of terms $=160$

Lower quartile $\left(Q_{1}\right)=\left(\frac{160}{4}\right)^{\text {th }}$ term $=40^{\text {th }}$ term $=28$
Upper quartile $\left(Q_{3}\right)=\left(\frac{3 \times 160}{4}\right)^{\text {th }}$ term $=120^{\text {th }}$ term $=60$
$\therefore$ Inter-quartile range $=Q_{3}-Q_{1}=60-28=32$
(iii) Since $85 \%$ scores $=85 \%$ of $100=85$

Through mark for 85 on $x$-axis, draw a vertical line which meets the ogive drawn at point B.
Through the point B, draw a horizontal line which meets the $y$-axis at the mark of 150 .
$\Rightarrow$ Number of shooters who obtained more than $85 \%$ score $=160-150=10$
8. (a) Let $\frac{x}{a}=\frac{y}{b}=\frac{z}{c}=k$
$\Rightarrow \mathrm{x}=\mathrm{ak}, \mathrm{y}=\mathrm{bk}, \mathrm{z}=\mathrm{ck}$
L.H.S. $=\frac{x^{3}}{a^{3}}+\frac{y^{3}}{b^{3}}+\frac{z^{3}}{c^{3}}$
$=\frac{(\mathrm{ak})^{3}}{\mathrm{a}^{3}}+\frac{(\mathrm{bk})^{3}}{\mathrm{~b}^{3}}+\frac{(\mathrm{ck})^{3}}{\mathrm{c}^{3}}$
$=\frac{a^{3} k^{3}}{a^{3}}+\frac{b^{3} k^{3}}{b^{3}}+\frac{c^{3} k^{3}}{c^{3}}$
$=\mathrm{k}^{3}+\mathrm{k}^{3}+\mathrm{k}^{3}$
$=3 \mathrm{k}^{3}$
R.H.S. $=\frac{3 \mathrm{xyz}}{\mathrm{abc}}$

$$
=\frac{3(\mathrm{ak})(\mathrm{bk})(\mathrm{ck})}{\mathrm{abc}}
$$

$$
=3 \mathrm{k}^{3}
$$

= L.H.S.
$\Rightarrow$ L.H.S. $=$ R.H.S.
$\Rightarrow \frac{\mathrm{x}^{3}}{\mathrm{a}^{3}}+\frac{\mathrm{y}^{3}}{\mathrm{~b}^{3}}+\frac{\mathrm{z}^{3}}{\mathrm{c}^{3}}=\frac{3 \mathrm{xyz}}{\mathrm{abc}}$
(b) Steps for construction:
(i) Draw $\mathrm{AB}=5 \mathrm{~cm}$ using a ruler.
(ii) With A as the centre cut an arc of 3 cm on AB to obtain C .
(iii) With A as the centre and radius 2.5 cm , draw an arc above AB .
(iv) With same radius, and C as the centre draw an arc to cut the previous arc and mark the intersection as 0 .
(v) With O as the centre and radius 2.5 cm , draw a circle so that points A and C lie on the circle formed.
(vi) Join OB.
(vii) Draw the perpendicular bisector of OB to obtain the mid-point of OB, M.
(viii) With the M as the centre and radius equal to OM, draw a circle to cut the previous circle at points $P$ and $Q$.
(ix) Join PB and QB. PB and QB are the required tangents to the given circle from exterior point B.

$\mathrm{QB}=\mathrm{PB}=3 \mathrm{~cm}$
That is, length of the tangents is 3 cm .
(c) (i) Since, A lies on the $x$-axis, let the coordinates of $A$ be ( $x, 0$ ).

Since Blies on the $y$ - axis, let the coordinates of Bbe ( $0, y$ ).
Let $\mathrm{m}=1$ and $\mathrm{n}=2$.
Using section formula,
Coordinates of $\mathrm{P}=\left(\frac{1(0)+2(\mathrm{x})}{1+2}, \frac{1 \mathrm{y}+2(0)}{1+2}\right)$
$\Rightarrow(4,-1)=\left(\frac{2 x}{3}, \frac{y}{3}\right)$
$\Rightarrow \frac{2 \mathrm{x}}{3}=4$ and $\frac{\mathrm{y}}{3}=-1$
$\Rightarrow \mathrm{x}=6$ and $\mathrm{y}=-3$
So, the coordinates of $A$ are $(6,0)$ and that of $B$ are $(0,-3)$.
(ii) Slope of $A B=\frac{-3-0}{0-6}=\frac{-3}{-6}=\frac{1}{2}$
$\Rightarrow$ Slope of line perpendicular to $A B=m=-2$
$\mathrm{P}=(4,-1)$
$\Rightarrow$ Required equation is
$\mathrm{y}-\mathrm{y}_{1}=\mathrm{m}\left(\mathrm{x}-\mathrm{x}_{1}\right)$
$\Rightarrow \mathrm{y}-(-1)=-2(\mathrm{x}-4)$
$\Rightarrow y+1=-2 x+8$
$\Rightarrow 2 \mathrm{x}+\mathrm{y}=7$
9. (a) Marked price of the article = Rs. 6,000.

A dealer buys an article at a discount of $30 \%$ from the wholesaler.
$\therefore$ Price of the article which the dealer paid to the wholesaler
$=6000-30 \%$ of 6000
$=6000-\frac{30}{100} \times 6000$
$=$ Rs. 4200
Sales tax paid by dealer $=6 \%$ of $4200=\frac{6}{100} \times 4200=$ Rs. 252
$\therefore$ Amount of the article inclusive of sales tax at which the dealer bought it
$=$ Rs. 4200 + Rs. 252 = Rs. 4452

Dealer sells the article at a discount of $10 \%$ to the shopkeeper.
$\therefore$ Price of the article which the shopkeeper paid to the dealer
$=6000-10 \%$ of 6000
$=6000-\frac{10}{100} \times 6000$
$=$ Rs. 5400

Sales tax paid by shopkeeper $=6 \%$ of $5400=\frac{6}{100} \times 5400=$ Rs. 324
$\therefore$ Amount of the article inclusive of sales tax at which the shopkeeper bought it $=$ Rs. 5400 + Rs. $324=$ Rs. 5724

The value added by dealer $=$ Rs. $5400-$ Rs. $4200=$ Rs. 1200

Amount of VAT paid by dealer
$=6 \%$ of 1200
$=\frac{6}{100} \times 1200$
$=$ Rs. 72
$\therefore$ Price paid by shopkeeper including tax is Rs 5724.
$\therefore$ VAT paid by dealer is Rs. 72 .
(b) (i) Area of the shaded part = Area of the circle + area of the semicircle

$$
\begin{aligned}
& =\pi(2.5)^{2}+\frac{\pi(2)^{2}}{2} \\
& =\pi[6.25+2] \\
& =\frac{22}{7}[8.25] \\
& \approx 26 \mathrm{~cm}^{2}
\end{aligned}
$$

(ii) Area of kite $=\frac{\text { product of the diagonals }}{2}=\frac{\mathrm{AC} \times \mathrm{BD}}{2}=\frac{12 \times 8}{2}=48 \mathrm{~cm}^{2}$

$$
\begin{aligned}
\text { Area of the unshaded part } & =\text { Area of the kite }- \text { Area of the shaded part } \\
& =48-26 \\
& =22 \mathrm{~cm}^{2}
\end{aligned}
$$

(c) (i) Scale factor $\mathrm{k}=\frac{1}{300}$

Length of the model of the ship $=\mathrm{k} \times$ Length of the ship
$\Rightarrow 2=\frac{1}{300} \times$ Length of the ship
$\Rightarrow$ Length of the ship $=600 \mathrm{~m}$
(ii) Area of the deck of the model $=\mathrm{k}^{2} \times$ Area of the deck of the ship
$\Rightarrow$ Area of the deck of the model $=\left(\frac{1}{300}\right)^{2} \times 180,000$

$$
\begin{aligned}
& =\frac{1}{90000} \times 180,000 \\
& =2 \mathrm{~m}^{2}
\end{aligned}
$$

(iii) Volume of the model $=\mathrm{k}^{3} \times$ Volume of the ship
$\Rightarrow 6.5=\left(\frac{1}{300}\right)^{3} \times$ Volume of the ship
$\Rightarrow$ Volume of the ship $=6.5 \times 27000000=175500000 \mathrm{~m}^{3}$
10. (a) (i) $I=$ Rs. $1200, n=2 \times 12=24$ months, $r=6 \%$

$$
\begin{aligned}
& \mathrm{I}=\mathrm{P} \times \frac{\mathrm{n}(\mathrm{n}+1)}{2 \times 12} \times \frac{\mathrm{r}}{100} \\
& \Rightarrow 1200=\mathrm{P} \times \frac{24 \times 25}{24} \times \frac{6}{100} \\
& \Rightarrow 1200=\mathrm{P} \times \frac{3}{2} \\
& \Rightarrow \mathrm{P}=\frac{1200 \times 2}{3} \\
& \Rightarrow \mathrm{P}=\text { Rs. } 800
\end{aligned}
$$

So the monthly instalment is Rs. 800.
(ii) Total sum deposited $=\mathrm{P} \times \mathrm{n}=$ Rs. $800 \times 24=$ Rs. 19200
$\therefore$ Amount of maturity $=$ Total sum deposited + Interest on it

$$
\begin{aligned}
& =\text { Rs. } 19200+\text { Rs. } 1200 \\
& =\text { Rs. } 20400
\end{aligned}
$$

(b) (i)

| Class interval | Frequency |
| :---: | :---: |
| $0-10$ | 2 |
| $10-20$ | 5 |
| $20-30$ | 8 |
| $30-40$ | 4 |
| $40-50$ | 6 |

(ii)

| Class interval | Frequency <br> $(\mathrm{f})$ | Mean value <br> $(\mathrm{x})$ | fx |
| :---: | :---: | :---: | :---: |
| $0-10$ | 2 | 5 | 10 |
| $10-20$ | 5 | 15 | 75 |
| $20-30$ | 8 | 25 | 200 |
| $30-40$ | 4 | 35 | 140 |
| $40-50$ | 6 | 45 | 270 |
|  | $\Sigma \mathrm{f}=25$ |  | $\Sigma \mathrm{f}=695$ |

$$
\therefore \text { Mean }=\frac{\sum \mathrm{fx}}{\sum \mathrm{f}}=\frac{695}{25}=27.8
$$

(iii) Here the maximum frequency is 8 which is corresponding to class $20-30$. Hence, the modal class is $20-30$.
(c) Time taken by bus to cover total distance with speed $\mathrm{x} \mathrm{km} / \mathrm{h}=\frac{240}{\mathrm{x}}$

Time taken by bus to cover total distance with speed $(x-10) k m / h=\frac{240}{x-10}$ According to the given condition,
$\frac{240}{x-10}-\frac{240}{x}=2$
$\Rightarrow 240\left(\frac{1}{x-10}-\frac{1}{x}\right)=2$
$\Rightarrow \frac{1}{x-10}-\frac{1}{x}=\frac{1}{120}$
$\Rightarrow \frac{x-x+10}{x(x-10)}=\frac{1}{120}$
$\Rightarrow \frac{10}{x^{2}-10 x}=\frac{1}{120}$
$\Rightarrow \mathrm{x}^{2}-10 \mathrm{x}=1200$
$\Rightarrow \mathrm{x}^{2}-10 \mathrm{x}-1200=0$
$\Rightarrow(\mathrm{x}-40)(\mathrm{x}+30)=0$
$\Rightarrow \mathrm{x}-40=0$ or $\mathrm{x}+30=0$
$\Rightarrow \mathrm{x}=40$ or $\mathrm{x}=-30$
Since, the speed cannot be negative, the uniform speed is $40 \mathrm{~km} / \mathrm{h}$.
11. (a) L.H.S. $=\frac{\cos A}{1+\sin A}+\tan A$

$$
\begin{aligned}
& =\frac{\cos A(1-\sin A)}{(1+\sin A)(1-\sin A)}+\frac{\sin A}{\cos A} \\
& =\frac{\cos A-\sin A \cos A}{1-\sin ^{2} A}+\frac{\sin A}{\cos A} \\
& =\frac{\cos A-\sin A \cos A}{\cos ^{2} A}+\frac{\sin A}{\cos A} \\
& =\frac{1}{\cos A}-\frac{\sin A}{\cos A}+\frac{\sin A}{\cos A} \\
& =\frac{1}{\cos A} \\
& =\sec A \\
& =\text { R.H.S }
\end{aligned}
$$

(b) (i) Steps of construction:

1. Draw $\mathrm{BC}=6.5 \mathrm{~cm}$ using a ruler.
2. With $B$ as the centre and radius equal to approximately half of $B C$, draw an arc that cuts the segment $B C$ at $Q$.
3. With $Q$ as the centre, and same radius, cut the previous arc at $P$.
4. Join BP and extend it.
5. With B as the centre and radius 5 cm , draw an arc that cuts the arm PB to obtain point A.
6. Join AC to obtain $\triangle \mathrm{ABC}$.

(ii)Steps for construction :
7. With A as the centre and radius 3.5 cm , draw a circle.
8. The circumference of a circle is the required locus.

(iii)Steps for construction :
9. With C as the centre and with radius of a length less than CA or BC , draw an arc to cut the line segments AC and BC at D and E respectively.
10. With the same radius or a suitable radius and with Das the centre, draw an arc of a circle.
11. With the same radius and with E as the centre draw an arc such that the two arcs intersect at H .
12. Join C and H .
13. CH is the bisector of $Đ A C B$ and is the required locus.

(iv) Steps for construction:
14. We known that the points at a distance of 3.5 cm from A will surely lie on the circle with centre A.
15. Also, the points on the angle bisector CH are the points equidistant from $A C$ and BC.
16. Mark X and Y which are at the intersection of the circle and the angle bisector CH.
17. Measure XY. XY=5cm
(c)
(i) Total dividend $=$ Rs.2,475

Dividend on each share $=12 \%$ of Rs. $25=\frac{12}{100} \times 25=$ Rs. 3
$\therefore$ Number of shares bought $=\frac{\text { Total dividend }}{\text { Dividend on 1 share }}=\frac{2475}{3}=825$
(ii) Market value of each share $=\frac{\text { Total Investment }}{\text { Number of shares bought }}=\frac{26400}{825}=$ Rs. 32
