1. Intensity at a distance $x$ from point source is given by,
$\mathrm{I}=\frac{\mathrm{P}}{4 \pi \mathrm{x}^{2}}$
Consider an elemental shell of radius ' $x$ ' and thickness dx , in this region, the energy contained is,
$\mathrm{dE}=\frac{\mathrm{I}}{\mathrm{C}}\left(4 \pi \mathrm{x}^{2} \mathrm{dx}\right)=\frac{P d x}{C}$
Let dn be the number of photons in this elemental shell,
Thendn $\times \frac{h C}{\lambda}=d E=\frac{P d x}{C}$
$\Rightarrow \mathrm{dn}=\frac{\mathrm{p} \lambda \mathrm{dx}}{\mathrm{hc}^{2}}$
Total no. of photons in the shell of inner radius ' $r$ ' and outer radius $2 r$ is
$\mathrm{n}=\int \mathrm{dn}=\int_{\mathrm{r}}^{2 \mathrm{r}} \frac{\mathrm{P} \lambda \mathrm{dx}}{\mathrm{hC}^{2}}=\frac{\mathrm{P} \lambda \mathrm{r}}{\mathrm{hC}^{2}}$
2. The situation is as shown in the figure. At any time ' t ' its location is described by two parameters -ri.e, the distance from centre and $\theta$, the angle rotated by spoke in time ' t '.
Velocity of bead at time $t, \vec{v}=u \hat{e}_{r}+r \omega \hat{e}_{t}$
Where $\hat{\mathrm{e}}_{\mathrm{r}} \& \hat{\mathrm{e}}_{\mathrm{t}}$ one unit vectors along radial and tangential
 directions

$$
\therefore \overrightarrow{\mathrm{v}}=\mathrm{u} \hat{\mathrm{e}}_{\mathrm{r}}+(\mathrm{ut}) \omega \hat{\mathrm{e}}_{\mathrm{t}} \text { where } \mathrm{r}=\mathrm{ut} \text { as } \frac{\mathrm{dr}}{\mathrm{dt}}=\mathrm{u}
$$

3. In LR growth circuit current grows to $63.2 \%$ of its maximum value, in one time constant, it means required time is
$\mathrm{t}=\mathrm{T}=\frac{\mathrm{L}}{\mathrm{R}}$
If the circuit is switched on at $t=0$,
$i(t)=\frac{E}{R}\left[1-e^{-t / T}\right]\left[T=\frac{L}{R}\right]$
$\therefore \mathrm{I}_{\text {max }}=\frac{\mathrm{E}}{\mathrm{R}}$

$\Rightarrow 3=\frac{8}{\mathrm{R}} \Rightarrow \mathrm{R}=\frac{8}{3} \Omega$
So, $t=T=\frac{L}{R}=\frac{6 \times 10^{-3}}{\frac{8}{3}}=\frac{9}{4} \mathrm{~ms}$
4. $\frac{d v}{d t}=v \frac{d v}{d x}=-K x^{2}$
$\Rightarrow V d v=-K x^{2} d x$

Let $V_{1}$ and $V_{2}$ be the velocities of the particle at locations $x_{1}$ and $x_{2}$ respectively. Then
$\frac{v_{2}^{2}-v_{1}^{2}}{2}=-K\left[\frac{\mathrm{x}_{2}^{3}-\mathrm{x}_{1}^{3}}{3}\right]$
So, loss in K.E a $x^{3}$
5. The given system can be redrawn as

The above simplification has been done by using series and parallel combinations of springs and the reduced mass concept.
In series, $\frac{1}{\mathrm{~K}_{\mathrm{eq}}}=\frac{1}{\mathrm{~K}_{1}}+\frac{1}{\mathrm{~K}_{2}}$, In parallel, $\mathrm{K}_{\mathrm{eq}}=\mathrm{K}_{1}+\mathrm{K}_{2}$. Reduced mass, $\mu=\frac{\mathrm{m}_{1} \mathrm{~m}_{2}}{\mathrm{~m}_{1}+\mathrm{m}_{2}}$
Required time period, $T=2 \pi \sqrt{\frac{\mu}{K_{e q}}}=3 \pi \sqrt{\frac{\mathrm{~m}}{7 \mathrm{k}}}$.
6. Temperature is decreasing we are going out, let at a distance ' $x$ ' from the centre, the temperature gradient is $\frac{-\mathrm{dT}}{\mathrm{dx}}$

At this location, $\mathrm{K}=\mathrm{a}_{0} \mathrm{Tx}$
From $\mathrm{H}=-\mathrm{KA}\left(\frac{-\mathrm{dT}}{\mathrm{dx}}\right)$
$\Rightarrow H=\left(-\mathrm{a}_{0} T \mathrm{x}\right)\left(4 \pi \mathrm{x}^{2}\right)\left(\frac{\mathrm{dT}}{\mathrm{dx}}\right)$
$\Rightarrow \int_{R_{1}}^{R_{2}} \frac{H d x}{x^{3}}=-\int_{T_{1}}^{T_{2}} 4 \pi \mathrm{a}_{0} \mathrm{TdT}$
$\Rightarrow \mathrm{H}=\frac{4 \pi \mathrm{a}_{0} \mathrm{R}_{1}^{2} \mathrm{R}_{2}^{2}\left(\mathrm{~T}_{1}^{2}-\mathrm{T}_{2}^{2}\right)}{\mathrm{R}_{2}^{2}-\mathrm{R}_{2}^{2}}$
7. In this case, we can't take reference point for potential at infinity as wire itself is of infinite dimension and hence we can't define absolute potential due to infinite
(charged) wire. Only potential difference between two points can be found, provided none of the point lies on wire.
8. $\quad \overrightarrow{\mathrm{V}}_{\mathrm{cm}}=\frac{m_{1} \overrightarrow{\mathrm{~V}}_{1}+\mathrm{m}_{2} \overrightarrow{\mathrm{~V}}_{2}}{m_{1}+m_{2}}=\frac{6 \hat{\imath}+5 \hat{\jmath}}{5}$
$\overrightarrow{\mathrm{a}}_{\mathrm{cm}}=\frac{m_{1} \overrightarrow{\mathrm{a}}_{1}+\mathrm{m}_{2} \overrightarrow{\mathrm{a}}_{2}}{m_{1}+m_{2}}=\frac{6 \hat{i}+6 \hat{}}{5}$
As $\vec{V}_{\mathrm{cm}} \| \overrightarrow{\mathrm{a}}_{\mathrm{cm}}$, so centre of mass follows a straight line path.
9. The components ofvarious velocities are as shown in the figure below:
$\overrightarrow{\mathrm{V}}_{\mathrm{IM}_{1}}=(100 \hat{1}) \mathrm{cm} / \mathrm{s}$
$\overrightarrow{\mathrm{V}}_{\mathrm{IM}_{2}}$ is given by the vector sum of components of velocity of image w.r. to $\mathrm{M}_{2}$ along the normal and perpendicular to the normal
$\overrightarrow{\mathrm{V}}_{\mathrm{IM}_{2}}=\left[100 \sin ^{2} 37^{0} \hat{\imath}+\right.$

$\left.100 \sin 37^{0} \cos 37^{\circ} \mathrm{j}\right]+$

$$
\begin{aligned}
& \Rightarrow=\left(-100 \cos ^{2} 37^{0} \hat{\imath}+100 \sin 37^{0} \cos 37^{0} \mathrm{j}\right] \\
& \therefore \vec{V}_{\mathrm{IM}_{2}}-\overrightarrow{\mathrm{V}}_{\mathrm{IM}_{1}}=[-128 \hat{\imath}+48 \hat{\jmath}) \mathrm{cm} / \mathrm{s} \\
& \hline 8 \hat{\jmath}] \mathrm{cm} / \mathrm{s}
\end{aligned}
$$

10. Let a satellite of mass ' $m$ ' is revolving around the earth of mass ' $M$ ' in a circle of radius ' $r$ '(> radius of earth), then its total mechanical energy in the orbit is given by,
$\mathrm{T} . \mathrm{E}=\mathrm{P} . \mathrm{E}+\mathrm{K} . \mathrm{E}=-\frac{G M m}{r}+\frac{G M m}{2 r}=-\frac{G M m}{2 r}=-(\mathrm{K} . \mathrm{E})$
So , T.E $=-\mathrm{E}_{\mathrm{K}} \quad$ (Given K.E=Eк)
Let ' $x$ ' is the amount of energy supplied to the satellite in its orbit so that it goes to infinity where its total energy is zero.

Appling law of conservation of energy, $x+$ T.E $=0$
So, $x=-\left(\right.$ T.E) $=-\left(-E_{k}\right)=E_{\kappa}$.
11. Let the velocity of rod be ' $V$ ' when it has been displaced by ' $x$ ' due to motion of rod an emf, will be induced in rod given by $\mathrm{e}=\mathrm{BVL}$, due to this induced emf, charging of the capacitor takes place as a current, flows in the circuit [for very small time] as a result of this current, the rod experiences a magnetic force given by IBL.

From Newton's II $^{\text {nd }}$ law,
$L \operatorname{LBl}+\mathrm{Kx}=\mathrm{ma}$
$\Rightarrow \mathrm{I}=\frac{\mathrm{d}}{\mathrm{dt}}(\mathrm{Q})=\frac{\mathrm{d}}{\mathrm{dt}}(\mathrm{C} \times \mathrm{BvL})=\mathrm{CBl} \times \frac{\mathrm{dv}}{\mathrm{dt}}$
$\Rightarrow \quad \mathrm{a}=\frac{\mathrm{Kx}}{\mathrm{m}-\mathrm{B}^{2} \mathrm{~L}^{2} \mathrm{C}}=\omega^{2} \mathrm{X}$
12. Distance between two adjacent nodes is $\frac{\lambda}{2}=\frac{2 \pi / \mathrm{K}}{2}=\frac{\pi}{\mathrm{K}}$
13. $\mathrm{T}_{\mathrm{A}}+\mathrm{T}_{\mathrm{B}}=\mathrm{W}$
$\left(T_{A}\right)(x)=T_{B}(L-x)$
Solving the above equations
$T_{A}=\frac{w(L-x)}{L} ; T_{B}=\frac{W x}{L}$
Stress in ' $A$ ' $=\frac{T_{A}}{A_{A}}$ Where $A_{A}$ is cross section area wire ' $A$ '.

Stress in ' $B$ ' $=\frac{T_{B}}{A_{B}}$ where $A_{B}$ is cross section area
 wire 'B'

It is given $A_{A}=\frac{A_{B}}{2}, \frac{T_{A}}{A_{A}}=\frac{T_{B}}{A_{B}} \Rightarrow x=\frac{2 L}{3}$
14. Electric potential of the common centre, is
$V=\frac{\mathrm{q}_{1}}{4 \pi \varepsilon_{0} \mathrm{r}_{1}}+\frac{\mathrm{q}_{2}}{4 \pi \varepsilon_{0} \mathrm{r}_{2}}$
$\Rightarrow \mathrm{v}=\frac{\sigma}{\varepsilon_{0}} \times \mathrm{r}_{1}+\frac{\sigma}{\varepsilon_{0}} \times \mathrm{r}_{2}=\frac{\sigma}{\varepsilon_{0}}\left[\mathrm{r}_{1}+\mathrm{r}_{2}\right]\left[\begin{array}{c}\because \mathrm{q}_{1}=\left(4 \pi r_{1}^{2}\right) \sigma \\ \mathrm{q}_{2}=\left(4 \pi r_{2}^{2}\right) \sigma\end{array}\right]$
15. Let both the blocks are moving together with same acceleration a , then
$\mathrm{a}=\frac{\mathrm{F}}{\mathrm{M}+\mathrm{m}}, \mathrm{f}=\mathrm{Ma}=\frac{\mathrm{MF}}{\mathrm{M}+\mathrm{m}}$
For $\stackrel{M}{\mathrm{M}+\mathrm{m}}$ relative motion to be there between the blocks, $\mathrm{f} \leq \mathrm{f}_{\mathrm{L}}$

i.e, $\frac{\mathrm{MF}}{\mathrm{M}+\mathrm{m}} \leq \mu \mathrm{mg} \Rightarrow \mathrm{F} \leq \frac{\mu \mathrm{m}(\mathrm{M}+\mathrm{m}) \mathrm{g}}{\mathrm{M}}$
16. $\quad \lambda_{n}=\frac{h}{P_{n}}=\frac{h}{\mathrm{mv}_{\mathrm{n}}}$
$J_{n}=\frac{n h}{2 \pi}$
We know $v_{n} \propto \frac{1}{n}$ i.e., $\lambda_{n} \propto n$ and $J_{n} \propto n$
So $\lambda_{n}$ a $J_{n}$
17. The position of final image is independent of $b$ only when the rays are incident parallel to principal axis on concave lens, which is possible only when the object is kept at focus of plano convex lens.
$\therefore \frac{1}{a}=\frac{1}{f_{1}}=(\mu-1)\left(\frac{1}{R_{1}}-\frac{1}{R_{2}}\right)$
$=\left(\frac{3}{2}-1\right)\left(\frac{1}{10}-\frac{1}{\infty}\right)$
$\Rightarrow \mathrm{a}=20 \mathrm{~cm}$.
18. When screen is parallel to line joining coherent sources $S_{1}$ and $S_{2}$, then shape of fringe is hyperbolic but central bright fringe is straight line.
When screen is perpendicular to the line joining the sources $S_{1}$ and $S_{2}$, then the shape of fringe is circular.
19. $\mathrm{T}=\mathrm{mg}$

Wave speed $C=\sqrt{\frac{T}{P A}}$
From the given equation of wave,
$\mathrm{C}=\frac{\mathrm{w}}{\mathrm{K}}$
$\therefore \frac{\mathrm{w}}{\mathrm{K}}=\sqrt{\frac{\mathrm{T}}{\mathrm{PA}}} \Rightarrow \frac{\mathrm{w}^{2}}{\mathrm{~K}^{2}}=\frac{\mathrm{T}}{\mathrm{pA}}$
$\therefore \mathrm{T}=\frac{\mathrm{pAw}^{2}}{\mathrm{~K}^{2}}$ or $\mathrm{mg}=\frac{\mathrm{pAw}^{2}}{\mathrm{~K}^{2}} \Rightarrow \mathrm{~m}=\frac{\mathrm{pAw}^{2}}{\mathrm{~K}^{2} \mathrm{~g}}$
20. $\mu=\tan 60^{\circ}=\sqrt{3}$
$\frac{\sin i}{\sin r}=\sqrt{3} \Rightarrow \sin r=\frac{\sin 45^{\circ}}{\sqrt{3}}=\frac{1}{\sqrt{6}}$
$\Rightarrow r=\sin ^{-1}\left(\frac{1}{\sqrt{6}}\right)$
21. only $D_{1}$ and $D_{4}$ are forward biased. So, $I=\frac{V}{R}=\frac{5}{50}=0.1 A$.
22. $N=N_{0} \mathrm{e}^{-\lambda t}$
$\therefore \mathrm{N}_{1}=\mathrm{N}_{0} \mathrm{e}^{-10 \lambda_{0} \mathrm{t}}$
$\mathrm{N}_{2}=\mathrm{N}_{0} \mathrm{e}^{-\lambda_{0} \mathrm{t}}$
$\therefore \frac{\mathrm{N}_{1}}{\mathrm{~N}_{2}}=\frac{1}{\mathrm{e}}=\mathrm{e}^{-9 \lambda_{0} \mathrm{t}}$
$9 \lambda_{0} t=1$
$\Rightarrow t=\frac{1}{9} \lambda_{0}$.
23. ${ }_{92} \mathrm{U}^{238} \rightarrow{ }_{82} \mathrm{~Pb}^{214}+6{ }_{2} \mathrm{He}^{4}+2 \mathrm{e}^{-1}$

So $6 \alpha$ and $2 \beta$ are possible.
24. $\quad \mathrm{U}_{\mathrm{i}}=\frac{1}{2} \mathrm{CV}^{2}+\frac{1}{2} \mathrm{CV}^{2}=\mathrm{CV}^{2}$
$\mathrm{U}_{\mathrm{f}}=\frac{1}{2} \mathrm{KCV}^{2}+\frac{1}{2}(\mathrm{KC}) \frac{\mathrm{V}^{2}}{\mathrm{~K}^{2}}=\frac{1}{2} \mathrm{CV}^{2}\left(\mathrm{~K}+\frac{1}{\mathrm{~K}}\right)$
$\therefore \frac{\mathrm{U}_{\mathrm{i}}}{\mathrm{U}_{\mathrm{f}}}=\frac{1}{\frac{1}{2}\left(\frac{\mathrm{~K}^{2}+1}{\mathrm{~K}}\right)}=\frac{2 \mathrm{~K}}{\mathrm{~K}^{2}+1}=\frac{6}{10}=\frac{3}{5}$
25. $\quad \mathrm{R}_{1}=\frac{\mathrm{V}^{2}}{\mathrm{P}_{1}} ; \mathrm{R}_{2}=\frac{\mathrm{V}^{2}}{\mathrm{P}_{2}}$

$$
P_{\text {net }}=\frac{V^{2}}{R_{\text {net }}}=\frac{V^{2}}{\left(\frac{R_{1} R_{2}}{R_{1}+R_{2}}\right)}=\frac{V^{2}\left(R_{1}+R_{2}\right)}{R_{1} R_{2}}
$$

$$
\Rightarrow P_{n e t}=\frac{\mathrm{V}^{2}\left(\frac{\mathrm{~V}^{2}}{\mathrm{P}_{1}}+\frac{\mathrm{V}^{2}}{\mathrm{P}_{2}}\right)}{\frac{\mathrm{V}^{2}}{\mathrm{P}_{1}} \times \mathrm{V}^{2}} \frac{\mathrm{P}_{1}}{\mathrm{P}_{2}}+\mathrm{P}_{2}
$$

26. $f=\frac{1}{2 \pi \sqrt{\mathrm{LC}}}=\frac{1}{2 \pi \sqrt{5 \times 80 \times 10^{-6}}}$
$\Rightarrow \mathrm{f}=\frac{25}{\pi} \mathrm{~Hz}$
27. As relative velocity is doubled. $\frac{\mathrm{d} \phi}{\mathrm{dt}}$ is also doubled hence emf induced becomes doubled.
28. 

$$
\begin{aligned}
& d w=n R d T \\
& \text { anddw }=P d V \\
& \therefore P d V=n R d T=(2)(R)(200) \\
& \Rightarrow P d V=400 R
\end{aligned}
$$

29. At $\mathrm{x}=\sqrt{\frac{2 \mathrm{E}}{\mathrm{K}}}$

Potential energy $U=0[\because x>0]$
Total energy is purely kinetic
$\therefore \mathrm{E}=\frac{1}{2} \mathrm{mv}^{2} \Rightarrow \mathrm{v}=\sqrt{\frac{2 \mathrm{E}}{\mathrm{m}}}$
30. No friction is required for pure rolling of ring.

W_{\text {Ag }}=0.5934 \mathrm{~g} & \text { Let } \mathrm{W} \mathrm{t} \% \text { of } \mathrm{C}=8 \mathrm{x} \\
& \text { Let } \mathrm{W} \mathrm{t} \% \text { of } \mathrm{O}=16 \mathrm{x}
\end{array}
$$

Since its dibasic acid
$\therefore$ |mole of salt $=2$ moles of Ag
$\therefore$ moles of $\mathrm{Ag}=\frac{0.5934}{108}$
$\therefore$ moles of salt/Acid $=\frac{0.5934}{108} \times \frac{1}{2}$
Given amount of salt $=1 \mathrm{~g}$
$\therefore$ Molecular amount of salt $=\frac{1}{0.5934} \times 108 \times 2$

$$
=364 \mathrm{~g} / \mathrm{mol}
$$

now $x+8 x+16 x=364$

$$
x=14.5 g
$$

$\therefore$ moles of H $\oint 0=14.5$
Since $4+0$ are equal hence option b.
