64. (B) Undergoes  $S_N1$  reaction faster than (A) because in case of (B), the carbocation formed after the loss of  $\text{Cl}^-$  is stabilised by resonance, whereas, no such stabilisation is possible in the carbocation obtained from (A).
65. Allyl chloride shows high reactivity as the carbocation formed by hydrolysis is stabilised by resonance while no such stabilisation of carbocation exists in the case of *n*-propyl chloride.
66. Grignard reagents are highly reactive and react with water to give corresponding hydrocarbons.

77. **Hint :**  $\text{C}_2\text{H}_5\text{OH} + \text{HCl} \xrightarrow{\text{ZnCl}_2} \text{C}_2\text{H}_5\text{Cl} \xrightarrow{\text{NaI}} \text{C}_2\text{H}_5\text{I}$ .

78. **Hint :** It acts as a stronger nucleophile from the carbon end because it will lead to the formation of C—C bond which is more stable than the C—N bond.

95. **Hint :** Primary alkyl halides prefer to undergo substitution reaction by  $\text{S}_{\text{N}}2$  mechanism whereas tertiary halides undergo elimination reaction due to the formation of stable carbocation.
