19. Read the following passage : AS1
   As the process of digestion in the stomach nears completion, the contractions of the stomach decreases. This prompts the muscles called as Pyloric sphincter at the opening of the stomach and the first part of the small intestine or deodenum to relax. This opens the pathway into deodenum releasing the partially digested food (chyme) in small Quantities into the deodenum.

   Peristaltis involves the contraction of the muscle behind the food and the relaxation of the muscle in front of the food giving rise to a thrust that pushes the food forward through the digestive canal. A wave of contraction followed by relaxation in muscles help in forward movement of food.

Write the answers of the following questions.

   i) What is the use of peristaltic movement.
   ii) What are the changes that occurs by peristaltic movement and muscular movement in food canal?
   iii) What is the role of pyloric sphinctur?
   iv) What is the use of deuoderum
