Exercise - 15.1

1. (i) Always false. There are minimum 27 days in a month. Usually we have months of 30 and 31 days.  
(ii) Ambiguous. In a given year, Makara Sankranthi may or may not fall on Friday.  
(iii) Ambiguous. At some time in winter, there can be a possibility that Hyderabad have 2°C temperature.  
(iv) True, to the known fact, so far we can say this but it can be changed if scientists find evidences of life on other planets.  
(v) Always false. Dogs cannot fly.  
(vi) Ambiguous. In a leap year, February has 29 days.

2. (i) False, the sum of the interior angles of a quadrilateral is 360°.  
(ii) False - eg. all negative numbers.  
(iii) True- Rhombus has opposite side parallel to each other therefore rhombus is parallelogram.  
(iv) True  
(v) No, all square number can not be written as a sum of two odd numbers, eg. \( 9 = 4 + 5 \)  
(But we can write all square numbers as a sum of odd, eg. \( 9 = 1 + 3 + 5 \) numbers)
3. (i) Only natural number
(ii) Two times a natural number is always even.

\[ 2 \times \frac{5}{2} = 5 \text{ (odd number)} \]

(iii) For any \( x > 1, 3x + 1 > 4 \)  
(iv) For any \( x \geq 0, x^3 \geq 0 \)
(v) In an equilateral triangle, a median is also an angle bisector.

4. Take any negative number \( x, y \)
\[ x^2 = -2 \times -2 = 4 \quad (\text{here } x^2 < y^2) \]
\[ y^2 = -3 \times -3 = 9 \]

**Exercise - 15.2**

1. (i) Jeevan is mortal
(ii) No, \( X \) could be any other state person like marathi, gujarati, punjabi etc.
(iii) Gulag has red tongue.
(iv) All smarts need not be a president. Here we have given only that all presidents are smart. There could be some other people like some of the teachers, students who are smart too.

2. You need to turn over B and 8. If 8 has an even number on the other side, then the rule has been broken. Similarly, if 8 has a consonant on the other side, then the rule has been broken.

3. The answer is 35.
   - Statement ‘a’ does not help because by following the other clues you can tell that you need more than on digit.
   - Statement ‘b’ does not help because the one digit has to be larger than the tens-digit and the only multiple of 7 and 10 is 70 and 0 is smaller than the 7.
   - Statement ‘c’ helps because being a multiple of 7 conceals out a lot of numbers that could have been possibilities.
   - Statement ‘d’ helps because being an odd number it too cancels out a lot of other possibilities.
   - Statement ‘e’ does not help because the only multiple of 7 and 11 is 77 and the ones digit has to bigger than the tens digit.
   - Statement ‘f’ does not help.
   - Statement ‘g’ helps because by using it there will be few numbers left.
   - Statement ‘h’ helps by using it only 35 remains.
   So - 3, 4, 7 and 8 helps and they only are enough to get the number.
Exercise - 15.3

1. (i) The possible three conjectures are:
   a) The product of any three consecutive odd numbers is odd.
   b) The product of any three consecutive odd numbers is divisible by 3.
   c) The sum of all the digits present in product of three consecutive odd numbers is even.

(ii) The possible three conjectures are:
   a) The sum of any three consecutive numbers is always even.
   b) The sum of any three consecutive numbers is always divided by 3.
   c) The sum of any three consecutive numbers is always divided by 6.

4. \(111111^2 = 12345654321\)
   \(1111111^2 = 1234567654321\)
   Conjecture is true

6. Conjecture is false because you cannot find a composite number for \(x = 41\).

Exercise - 15.4

1. (i) No (ii) Yes (iii) No (iv) Yes (v) No

2. (i) A rectangle has equal angles but may not be a square.
   (ii) For \(x = 2; y = 3\), the statement is not true.
   (It is only true for \(x = 0; y = 1\) or \(x = 0, y = 0\))
   (iii) For \(n = 11, 2n^2 + 11 = 253\) which is not a prime number.
   (iv) You can give any two triangles with the same angles but of different sides.
   (v) A rhombus has equal sides but may not be a square.

3. Let \(x\) and \(y\) be two odd numbers. Then \(x = 2m + 1\) for some natural number \(m\) and \(y = 2n + 1\) for some natural number \(n\).
   \(x + y = 2(m + n + 1)\). Therefore, \(x + y\) is divisible by 2 and is even.

4. Let \(x = 2m\) and \(y = 2n\)
   Product \(xy = (2m)(2n) = 4 mn\)

6. (i) Let your original number be \(n\). Then we are doing the following operations:
   \(n \rightarrow 2n \rightarrow 2n + 9 \rightarrow +n = 3n + 9 \rightarrow \frac{3n + 9}{3} = n + 3 \rightarrow n + 3 + 4 = n + 7 \rightarrow n + 7 - n = 7\)
   (ii) Note that \(7 \times 11 \times 13 = 1001\). Take any three digit number say, \(abc\). Then \(abc \times 1001 = abcabc\). Therefore, the six digit number \(abcabc\) is divisible by 7, 11 and 13.
