## Lines and Angles

04

### 4.1 Introduction

Reshma and Gopi have drawn the sketches of their school and home respectively. Can you identify some angles and line segments in these sketches?

(i)

(ii)

In the above figures $(\mathrm{PQ}, \mathrm{RS}, \mathrm{ST}, \ldots)$ and $(\mathrm{AB}, \mathrm{BC}, \mathrm{CD}, \ldots)$ are examples of line segments. Where as $\angle \mathrm{UPQ}, \angle \mathrm{PQR}, \ldots$ and $\angle \mathrm{EAB}, \angle \mathrm{ABC}, \ldots$ are examples of some angles.

Do you know whenever an architect has to draw a plan for buildings, towers, bridges etc., the architect has to draw many lines and parallel lines at different angles.

In science say in Optics, we use lines and angles to assume and draw the movement of light and hence the images are formed by reflection, refraction and scattering. Similarly while finding how much work is done by different forces acting on a body, we consider angles between force and displacement to find resultants. To find the height of a place we need both angles and lines. So in our daily life, we come across situations in which the basic ideas of geometry are in muchuse.

## Do This

Observe your surroundings carefully and write any three situations of your daily life where you can observe lines and angles.
Draw the pictures in your note book and collect some pictures.

### 4.2 Basic Terms in Geometry

Think of a light beam originating from the sun or a torch light. How do you represent such a light beam? It's a ray starting from the sun. Recall that "a ray is a
 part of a line. It begins at a point and goes on endlessly in a specified direction. While line can be extended in both directions endlessly.

A part of a line with two end points is known as line segment.

We usually denote a line segment AB by $\overline{\mathrm{AB}}$ and its length in denoted by AB . The ray AB is denoted by $\overrightarrow{\mathrm{AB}}$ and a line is denoted by $\overleftrightarrow{\mathrm{AB}}$. However we normally use $\overleftrightarrow{\mathrm{AB}}, \overleftrightarrow{\mathrm{PQ}}$ for etc. lines and some times small letters $l, m, n$ etc. will also be used to denote lines.

If three or more points lie on the same line, they are called collinear points, otherwise they are called non-collinear points.

Sekhar marked some points on a line and try to count the line segments formed by them.
(Note $\overline{\mathrm{PQ}}$ and $\overline{\mathrm{QP}}$ represents the same line segment)

| S.No. | Points on line | Line Segments | Number |
| :---: | :---: | :---: | :---: |
| 1. | $\stackrel{\square}{\mathrm{P}} \quad \stackrel{\square}{\mathrm{R}} \quad \stackrel{\square}{\mathrm{Q}}$ | PQ, PR, RQ | 3 |
| 2. |  | PQ, PR, PS, SR, SQ, RQ | 6 |
| 3. |  | ................................... |  |

Do you find any pattern between the number of points and line segments?
Take some more points on the line and find the pattern:

| No. of points <br> on line segment | 2 | 3 | 4 | 5 | 6 | 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Total no. of <br> line segments | 1 | 3 | 6 | $\ldots .$. | $\ldots .$. | $\ldots .$. |

A circle is divided into 360 equal parts as shown in the figure.

The measure of each part is called one degree.

The angle is formed by rotating a ray from an initial position to a terminal position.

The change of a ray from initial position to terminal position around the fixed point ' O ' is called rotation and measure of rotation is called
 angle.

One complete rotation gives $360^{\circ}$. We also draw angles with compass.
An angle is formed when two rays originate from the same point. The rays making an angle are called arms of the angle and the common point is called vertex of the angle. You have studied different types of angles, such as acute angle, right angle, obtuse angle, straight

acute angle : $0^{\circ}<x<90^{\circ}$

right angle : $y=90^{\circ}$ angle and reflex angle in your earlier classes.

### 4.2.1 Intersecting Lines and Non-intersecting Lines

Observe the figure. Do the lines $\overleftrightarrow{\mathrm{PQ}}$ and $\overleftrightarrow{\mathrm{RS}}$ have any common points? What do we call such lines? They are called parallel lines.

On the other hand if they meet at any point, then they are called intersecting lines.

### 4.2.2 Concurrent Lines

How many lines can meet at a single point? Do you know the name of such lines? When three or more lines meet at a point, they are called concurrent lines and the point at which they meet is called point of concurrence.

## Think, Discuss and write

What is the difference between intersecting lines and concurrent lines?

## Exercise - 4.1

1. In the given figure, name:
(i) any six points
(ii) any five line segments
(iii) any four rays
(iv) any four lines
(v) any four collinear points

2. Observe the following figures and identify the type of angles in them.

3. State whether the following statements are true or false :
(i) A ray has no end point.
(ii) Line $\overrightarrow{\mathrm{AB}}$ is the same as line $\overrightarrow{\mathrm{BA}}$.
(iii) A ray $\overrightarrow{\mathrm{AB}}$ is same as the ray $\overrightarrow{\mathrm{BA}}$.
(iv) A line has a define length.
(v) A plane has length and breadth but no thickness.
(vi) Two distinct points always determine a unique line.
(vii) Two lines may intersect in two points.
(viii) Two intersecting lines cannot both be parallel to the same line.
4. What is the angle between two hands of a clock when the time in the clock is
(a) $9^{\prime} O$ clock
(b) 6 'O clock
(c) 7:00 PM

### 4.3 Pairs of Angles

Now let us discuss about some pairs of angles.
Observe the following figures and find the sum of angles.

What is the sum of the two angles shown in each figure? It is $90^{\circ}$. Do you know what do we call such pairs of angles? They are called complementary angles.

If a given angle is $x^{0}$, then what is its complementary angle? The complementary angle of $x^{0}$ is $\left(90^{0}-x^{0}\right)$.

Example-1. If the measure of an angle is $62^{\circ}$, what is the measure of its complementary angle?
Solution : As the sum is $90^{\circ}$, the complementary angle of $62^{\circ}$ is $90^{\circ}-62^{\circ}=28^{\circ}$
Now observe the following figures and find the sum of angles in each figure.

What is the sum of the two angles shown in each figure? It is $180^{\circ}$. Do you know what do we call such pair of angles? Yes, they are called supplementary angles. If the given angle is $\mathrm{x}^{0}$, then what is its supplementary angle ? The supplementary angle of $\mathrm{x}^{0}$ is $\left(180^{\circ}-x^{\circ}\right)$.

Example-2. Two complementary angles are in the ratio $4: 5$. Find the angles.
Solution : Let the required angles be $4 x$ and $5 x$.

$$
\text { Then } 4 x+5 x=90^{\circ} \quad \text { (Why?) }
$$

$$
9 x=90^{\circ} \Rightarrow x=10^{\circ}
$$

Hence the required angles are $40^{\circ}$ and $50^{\circ}$.
Now observe the pairs of angles such as $\left(120^{\circ}, 240^{\circ}\right)\left(100^{\circ}, 260^{\circ}\right)\left(180^{\circ}, 180^{\circ}\right)\left(50^{\circ}\right.$, $310^{\circ}$ ) .. etc. What do you call such pairs? The pair of angles, whose sum is $360^{\circ}$ are called conjugate angles. Can you say the conjugate angle of $270^{\circ}$ ? What is the conjuage angle of $x^{\circ}$ ?

## Do these

1. Write the complementary, supplementary and conjugate angles for the following angles.
(a) $45^{0}$
(b) $75^{\circ}$
(c) $215^{\circ}$
(d) $30^{0}$
(e) $60^{0}$
(f) $90^{\circ}$
(g) $180^{\circ}$
2. Which pairs of following angles become complementary or supplementary angles?

Observe the following figures, do they have any thing in common?

In figure (i) we can observe that vertex ' O ' and arm ' $\overrightarrow{\mathrm{OB}}$ ' are common to both $\angle 1$ and $\angle 2$. What can you say about the non-common arms and how are they arranged? They are arranged on either side of the common arm. What do you call such pairs of angles?

They are called a pair of adjacent angles.
In fig.(ii), two angles $\angle 1$ and $\angle 2$ are given. They have neither a common arm nor a common vertex. So they are not adjacent angles.

## Try This

(i) Find pairs of adjacent and non-adjacent angles in the above figures (i, ii, iii \& iv).
(ii) List the adjacent angles in the given figure.

From the above, we can conclude that pairs of angles which have a common vertex, a common arm and non common arms lie on either side of common arm are called adjacent angles.

Observe the given figure. The hand of the athlete is making angles with the Javelin. What kind of angles are they? Obviously they are adjacent angles. Further what will be the sum of those two angles? Because they are on a straight line, the sum of the angles is $180^{\circ}$. What do we call such pair of angles? They are called linear pair. So if the sum of two adjacent angles is $180^{\circ}$, they
 are said to be a linear pair.

## Think, Discuss and Write

Linear pair of angles are always supplementary. But supplementary angles need not form a linear pair. Why?

## Activity

Measure the angles in the following figure and complete the table.

| Figure | $\angle 1$ | $\angle 2$ | $\angle 1+\angle 2$ |
| :---: | :---: | :---: | :---: |
| (i) |  |  |  |
| (ii) |  |  |  |
| (iii) |  |  |  |

### 4.3.1 Linear pair of angles axiom

Axiom : If a ray stands on a straight line, then the sum of the two adjacent angles so formed is $180^{\circ}$.

When the sum of two adjacent angles is $180^{\circ}$, they are called a linear pair of angles.

In the given figure, $\angle 1+\angle 2=180^{\circ}$
Let us do the following. Draw adjacent angles of different measures as shown in the fig. Keep the ruler along one of the non-common arms in each case. Does the other non-common arm lie along the ruler?

You will find that only in fig. (iv), both the non-common arms lie along the ruler, that is non common arms from a straight line. Also observe that $\angle \mathrm{AOC}+\angle \mathrm{COB}=125^{\circ}+55^{\circ}$ $=180^{\circ}$. In other figures it is not so.

(iv)

Axiom : If the sum of two adjacent angles is $180^{\circ}$, then the non-common arms of the angles form a line. This is the converse of linear pair of angle axiom.

Angles at a point : We know that the sum of all the angles around a point is always $360^{\circ}$.
In the given figure $\angle 1+\angle 2+\angle 3+\angle 4+\angle 5=360^{\circ}$

### 4.3.2 Angles in intersecting lines

Draw any two intersecting lines and label them. Identify the linear pairs of angles and write down in your note book. How many pairs are formed?

In the figure, $\angle \mathrm{POS}$ and $\angle \mathrm{ROQ}$ are opposite angles with same vertex and have no common arm. So they are called as vertically opposite
 angles. (Some times called vertical angles).

How many pairs of vertically opposite angles are there? Can you find them? (See figure)

## Activity :

Measure the four angles 1, 2, 3, 4 in each of the above figure and complete the table:

| Figure | $\angle 1$ | $\angle 2$ | $\angle 3$ | $\angle 4$ |
| :---: | :---: | :---: | :---: | :---: |
| (i) |  |  |  |  |
| (ii) |  |  |  |  |
| (iii) |  |  |  |  |

What do you observe about the pairs of vertically opposite angles? Are they equal? Now let us prove this result in a logical way.

Theorem-4.1 : If two lines intersect each other, then the pairs of vertically opposite angles thus formed are equal.
Given: AB and CD be two lines intersecting at O
Required to prove (R.T.P.)
(i) $\angle \mathrm{AOC}=\angle \mathrm{BOD}$
(ii) $\angle \mathrm{AOD}=\angle \mathrm{BOC}$.

## Proof:

Ray $\overrightarrow{\mathrm{OA}}$ stands on Line $\overrightarrow{\mathrm{CD}}$

Therefore, $\angle \mathrm{AOC}+\angle \mathrm{AOD}=180^{\circ}$
Also $\angle \mathrm{AOD}+\angle \mathrm{BOD}=180^{\circ}$
$\angle \mathrm{AOC}+\angle \mathrm{AOD}=\angle \mathrm{AOD}+\angle \mathrm{BOD}$
$\angle A O C=\angle B O D$
[Linear pair angles axiom]
[Why?]
[From (1) and (2)]
[Cancellation of equal angles on both sides]

Similarly we can prove
$\angle \mathrm{AOD}=\angle \mathrm{BOC}$
Do it on your own.

## Do This

1. Classify the given angles as pairs of complementary, linear pair, vertically opposite and adjacent angles.

(i)

2. Find the measure of angle ' $a$ ' in each figure. Give reason in each case.

Now, let us do some examples.
Example - 3. In the adjacent figure, $\overrightarrow{\mathrm{AB}}$ is a straight line. Find the value of $x$ and also find $\angle \mathrm{AOC}, \angle \mathrm{COD}$ and $\angle \mathrm{BOD}$.

Solution : Since $\overrightarrow{\mathrm{AB}}$ is a stright line, the sum of all the angles on $\stackrel{\rightharpoonup}{\mathrm{AB}}$ at a point O is $180^{\circ}$.

$$
\begin{aligned}
& \therefore(3 x+7)^{\circ}+(2 x-19)^{\circ}+x=180^{\circ}(\text { Linear angles }) \\
& \quad \Rightarrow 6 x-12=180 \Rightarrow 6 x=192 \Rightarrow x=32^{\circ} . \\
& \quad \text { So, } \angle \mathrm{AOC}=(3 x+7)^{\circ}=(3 \times 32+7)^{\circ}=103^{\circ}, \\
& \quad \angle \mathrm{COD}=(2 x-19)^{\circ}=(2 \times 32-19)^{\circ}=45^{\circ}, \angle \mathrm{BOD}=32^{\circ} .
\end{aligned}
$$

Example - 4. In the adjacent figure lines PQ and RS intersect
each other at point O . If $\angle \mathrm{POR}: \angle \mathrm{ROQ}=5: 7$, find all the angles.

Solution: $\angle \mathrm{POR}+\angle \mathrm{ROQ}=180^{\circ}$ (Linear pair of angles)
But $\angle \mathrm{POR}: \angle \mathrm{ROQ}=5: 7$ (Given)

Therefore, $\angle \mathrm{POR}=\frac{5}{12} \times 180=75^{\circ}$
Similarly, $\angle \mathrm{ROQ}=\frac{7}{12} \times 180=105^{\circ}$
Now, $\angle \mathrm{POS}=\angle \mathrm{ROQ}=105^{\circ}$ (Vertically opposite angles)
and $\angle \mathrm{SOQ}=\angle \mathrm{POR}=75^{\circ}$ (Vertically opposite angles)
Example-5. Calculate $\angle \mathrm{AOC}, \angle \mathrm{BOD}$ and $\angle \mathrm{AOE}$ in the adjacent figure given that $\angle \mathrm{COD}=90^{\circ}, \angle \mathrm{BOE}=72^{\circ}$ and AOB is a straight line,

Solution : Since AOB is a straight line, we have :

$$
\begin{array}{r}
\angle \mathrm{AOE}+\angle \mathrm{BOE}=180^{\circ} \\
=3 x^{\circ}+72^{\circ}=180^{\circ} \\
\Rightarrow 3 x^{\circ}=108^{\circ} \Rightarrow x=36^{\circ} .
\end{array}
$$

$\Rightarrow x^{\circ}+90^{\circ}+y^{\circ}=180^{\circ}$
$\Rightarrow 36^{\circ}+90^{\circ}+y^{\circ}=180^{\circ}$

$$
y^{\circ}=180^{\circ}-126^{\circ}=54^{\circ}
$$

$$
\therefore \angle \mathrm{AOC}=36^{\circ}, \angle \mathrm{BOD}=54^{\circ} \text { and } \angle \mathrm{AOE}=108^{\circ} .
$$

Example-6. In the adjacent figure ray OS stands on a line PQ. Ray OR and ray OT are angle bisectors of $\angle \mathrm{POS}$ and $\angle \mathrm{SOQ}$ respectively. Find $\angle$ ROT.

Solution : Ray OS stands on the line PQ .

Therefore, $\angle \mathrm{POS}+\angle \mathrm{SOQ}=180^{\circ}$ (Linear pair)
Let $\quad \angle \mathrm{POS}=x^{\circ}$
Therefore, $x^{\circ}+\angle \mathrm{SOQ}=180^{\circ}$ (How?)
So, $\angle \mathrm{SOQ}=180^{\circ}-x^{\circ}$
Now, ray OR bisects $\angle \mathrm{POS}$, therefore,

$$
\begin{aligned}
\angle \mathrm{ROS} & =\frac{1}{2} \times \angle \mathrm{POS} \\
& =\frac{1}{2} \times x=\frac{x}{2}
\end{aligned}
$$

Similarly, $\angle \mathrm{SOT}=\frac{1}{2} \times \angle \mathrm{SOQ}$

$$
\begin{aligned}
& =\frac{1}{2} \times\left(180^{\circ}-x\right) \\
& =90^{\circ}-\frac{x^{\circ}}{2}
\end{aligned}
$$

Now, $\angle \mathrm{ROT}=\angle \mathrm{ROS}+\angle \mathrm{SOT}$

$$
\begin{aligned}
& =\frac{x^{\circ}}{2}+\left(90^{\circ}-\frac{x^{\circ}}{2}\right) \\
& =90^{\circ}
\end{aligned}
$$

Example-7. In the adjacent figure $\overrightarrow{\mathrm{OP}}, \overrightarrow{\mathrm{OQ}}, \overrightarrow{\mathrm{OR}}$ and $\overrightarrow{\mathrm{OS}}$ are four rays. Prove that

$$
\angle \mathrm{POQ}+\angle \mathrm{QOR}+\angle \mathrm{SOR}+\angle \mathrm{POS}=360^{\circ} .
$$

Solution : In the given figure, you need to draw opposite ray to any of the rays $\overrightarrow{\mathrm{OP}}, \overrightarrow{\mathrm{OQ}}, \overrightarrow{\mathrm{OR}}$ or $\overrightarrow{\mathrm{OS}}$

Draw ray $\overrightarrow{\mathrm{OT}}$ so that $\stackrel{\rightharpoonup}{\mathrm{TOQ}}$ is a line. Now, ray OP stands on line $\stackrel{\rightharpoonup}{\mathrm{TQ}}$.

Therefore, $\angle \mathrm{TOP}+\angle \mathrm{POQ}=180^{\circ}$.... (1) (Linear pair axiom)
Similarly, ray $\overrightarrow{\mathrm{OS}}$ stands on line $\overrightarrow{\mathrm{TQ}}$.
Therefore, $\angle \mathrm{TOS}+\angle \mathrm{SOQ}=180^{\circ} \quad \ldots$. (2) (why?)
But $\angle \mathrm{SOQ}=\angle \mathrm{SOR}+\angle \mathrm{QOR}$
So, (2) becomes
$\angle \mathrm{TOS}+\angle \mathrm{SOR}+\angle \mathrm{QOR}=180^{\circ}$
Now, adding (1) and (3), you get
$\angle \mathrm{TOP}+\angle \mathrm{POQ}+\angle \mathrm{TOS}+\angle \mathrm{SOR}+\angle \mathrm{QOR}=360^{\circ}$
But $\angle \mathrm{TOP}+\angle \mathrm{TOS}=\angle \mathrm{POS}$
Therefore, (4) becomes
$\angle \mathrm{POQ}+\angle \mathrm{QOR}+\angle \mathrm{SOR}+\angle \mathrm{POS}=360^{\circ}$

## Exercise - 4.2

1. In the given figure three lines $\stackrel{\rightharpoonup}{\mathrm{AB}}, \stackrel{\rightharpoonup}{\mathrm{CD}}$ and $\overleftrightarrow{\mathrm{EF}}$ intersecting at O . Find the values of $x, y$ and $z$ it is being given that $\mathrm{x}: \mathrm{y}: \mathrm{z}=2: 3: 5$
2. Find the value of $x$ in the following figures.

(i)

(iii)

(ii)

(iv)

3. In the given figure lines $\overrightarrow{\mathrm{XY}}$ and $\overrightarrow{\mathrm{MN}}$ intersect at O . If $\angle \mathrm{POY}=90^{\circ}$ and $\mathrm{a}: \mathrm{b}=2: 3$, find c .

4. In the given figure $\angle \mathrm{PQR}=\angle \mathrm{PRQ}$, then prove that

$$
\angle \mathrm{PQS}=\angle \mathrm{PRT}
$$

6. In the given figure, if $x+y=w+z$, then prove that AOB is a line.

7. In the given figure $\overleftrightarrow{\mathrm{PQ}}$ is a line. Ray $\overrightarrow{\mathrm{OR}}$ is perpendicular to line $\overleftrightarrow{\mathrm{PQ}} \cdot \overrightarrow{\mathrm{OS}}$ is another ray lying between rays $\overrightarrow{\mathrm{OP}}$ and $\overrightarrow{\mathrm{OR}}$.
Prove that $\angle \mathrm{ROS}=\frac{1}{2}(\angle \mathrm{QOS}-\angle \mathrm{POS})$

8. It is given that $\angle X Y Z=64^{\circ}$ and $X Y$ is produced to point $P$. A ray $Y Q$ bisects $\angle Z Y P$. Draw a figure from the given information. Find $\angle \mathrm{XYQ}$ and reflex $\angle \mathrm{QYP}$.

### 4.4 Lines and a Transversal

Observe the figure. At how many points the line $l$ meets the other lines $m$ and $n$ ? Line $l$ meets the lines at two distinct points. What do we call such a line? It is a transversal. It is a line which intersects two distinct lines at two distinct points. Line ' $l$ ' intersects lines ' m ' and ' $n$ ' at points ' P ' and ' Q ' respectively. So, line $l$ is a transversal for lines $m$ and $n$.

Observe the number of angles formed when a transversal intersects a pair of lines.

If a transversal meets two lines we get eight angles.
Let us name these angles as $\angle 1, \angle 2 \ldots \angle 8$ as shown in the figure. Can you classify these angles? Some angles are exterior and some are interior. $\angle 1, \angle 2, \angle 7$ and $\angle 8$ are called exterior angles, while $\angle 3, \angle 4, \angle 5$ and $\angle 6$ are called interior angles.

The angles which are non-adjacent and lie on the same side of the transversal of which one is interior and the other is exterior, are called corresponding angles.

From the given figure.
(a) What are corresponding angles?
(i) $\angle 1$ and $\angle 5$ (ii) $\angle 2$ and $\angle 6$
(iii) $\angle 4$ and $\angle 8$ (iv) $\angle 3$ and $\angle 7$, So there are 4 pairs of corresponding angles.
(b) What are alternate interior angles?
(i) $\angle 4$ and $\angle 6$
(ii) $\angle 3$ and $\angle 5$, are two pairs of alternate interior angles.(Why?)
(c) What are alternate exterior angles?
(i) $\angle 1$ and $\angle 7$
(ii) $\angle 2$ and $\angle 8$, are two pairs of alternate exterior angles. (Why?)
(d) What are interior angles on the same side of the transversal?
(i) $\angle 4$ and $\angle 5$
(ii) $\angle 3$ and $\angle 6$
are two pairs of interior angles on the same side of the transversal. (Why?)

Interior angles on the same side of the transversal are also referred to as consecutive interior angles or co-interior angles or allied interior angles.
(e) What are exterior angles on the same side of the transversal?
(i) $\angle 1, \angle 8$
(ii) $\angle 2, \angle 7$
are two pairs of exterior angles on the same side of the transversal. (Why?)

Exterior angles on the same side of the transversal are also referred as consecutive exterior angle or co-exterior angles or allied exterior angles?

What can we say about the corresponding angles formed when the two lines $l$ and $m$ are parallel? Check and find. Will they become equal? Yes, they are equal.

Axiom of corresponding angles: If a transversal intersects a pair of parallel lines, then each pair of corresponding angles are equal.

What is the relation between the pairs of alternate interior angles (i) $\angle \mathrm{BQR}$ and $\angle \mathrm{QRC}$
(ii) $\angle \mathrm{AQR}$ and $\angle \mathrm{QRD}$ in the figure?

Can we use corresponding angles axiom to find the relation between these alternate interior angles.

In the figure, the transversal $\overleftrightarrow{\mathrm{PS}}$ intersects two parallel lines $\overleftrightarrow{\mathrm{AB}}$ and $\overleftrightarrow{\mathrm{CD}}$ at points Q and $R$ respectively.

Let us prove $\angle \mathrm{BQR}=\angle \mathrm{QRC}$ and $\angle \mathrm{AQR}=\angle \mathrm{QRD}$
You know that $\angle \mathrm{PQA}=\angle \mathrm{QRC}$
.....(1) (corresponding angles axiom)
And $\angle \mathrm{PQA}=\angle \mathrm{BQR}$
..... (2) (Why?)
So, from (1) and (2), you may conclude that $\angle \mathrm{BQR}=\angle \mathrm{QRC}$.
Similarly, $\angle \mathrm{AQR}=\angle \mathrm{QRD}$.
This result can be stated as a theorem as follows:
Theorem-4.2 : If a transversal intersects two parallel lines, then each pair of alternate interior angles are equal.

In a similar way, you can obtain the following theorem related to interior angles on the same side of the transversal.

Theorem-4.3 : If a transversal intersects two parallel lines, then each pair of interior angles on the same side of the transversal are supplementary.

## Do These

1. Find the measure of each angle indicated in each figure where $l$ and $m$ are parallel lines intersected by transversal $n$.

2. Solve for ' $x$ ' and give reasons.

## Activity

Take a scale and a 'set square'. Arrange the set square on the scale as shown in figure. Along the slant edge of set square draw a line with the pencil. Now slide your set square along its horizontal edge and again draw a line. We observe that the lines are parallel. Why are they parallel? Think and
 discuss with your friends.

## Do This

Draw a line $\stackrel{\rightharpoonup}{\mathrm{AD}}$ and mark points B and C on it. At $B$ and $C$, construct $\angle \mathrm{ABQ}$ and $\angle \mathrm{BCS}$ equal to each other as shown. Produce QB and SC on the other side of AD to form two lines PQ and RS .

Draw common perpendiculars EF and GH for the two lines PQ and RS. Measure the lengths of EF and GH. What do you observe? What can you conclude from that? Recall that if the perpendicular distance between two lines is the same, then they are parallel lines.

Axiom-1 : If a transversal intersects two lines such that a pair of corresponding angles are equal, then the two lines are parallel to each other.

A plumb bob is a weight hung at the end of a string and the string here is called a plumb line. The weight pulls the string straignt down so that the plumb line is perfectly vertical. Suppose the angle between the wall and the roof is $120^{\circ}$ and the angle formed by the plumb line and the roof is $120^{\circ}$. Then the mason concludes that the wall is vertical to the ground. Think, how he has come to this conclusion?

Now, using the converse of the corresponding angles axiom, can we show the two lines are parallel if a pair of alternate
 interior angles are equal?

In the figure, the transversal PS intersects lines $\overrightarrow{\mathrm{AB}}$ and $\overrightarrow{\mathrm{CD}}$ at points Q and R respectively such that the alternate interior angles $\angle \mathrm{BQR}$ and $\angle \mathrm{QRC}$ are equal.
i.e. $\angle \mathrm{BQR}=\angle \mathrm{QRC}$.

Now we need to prove this $A B \| C D$

$$
\begin{equation*}
\angle \mathrm{BQR}=\angle \mathrm{PQA}(\mathrm{Why} ?) \tag{1}
\end{equation*}
$$

But, $\quad \angle \mathrm{BQR}=\angle \mathrm{QRC}$ (Given)
So, from (1) and (2),

$$
\angle \mathrm{PQA}=\angle \mathrm{QRC}
$$

But they are corresponding angles for the pair of lines $\overleftrightarrow{\mathrm{AB}}$ and $\overleftrightarrow{\mathrm{CD}}$ with transversal $\overleftrightarrow{\mathrm{PS}}$.
So, $\overleftrightarrow{\mathrm{AB}} \| \overleftrightarrow{\mathrm{CD}}$ (Converse of corresponding angles axiom)
This result can be stated as a theorem as given below:
Theorem-4.4 : If a transversal intersects two lines such that a pair of alternate interior angles are equal, then the two lines are parallel.

### 4.4.1 Lines Parallel to the Same Line

If two lines are parallel to the same line, will they be parallel to each other?

Let us check it. Draw three line $l, m$ and $n$ such that $m \| l$ and $n \| l$.

Let us draw a transversal ' $t$ ' on the lines, $l, m$ and $n$.

Now from the figure $\angle 1=\angle 2$ and $\angle 1=\angle 3$ (Corresponding angles axiom)
So, $\angle 2=\angle 3$ But these two form a pair of corresponding angles for the lines $m \& n$.
Therefore, you can say that $m \| n$.
(Converse of corresponding angles axiom)
Theorem-4.5 : Lines which are parallel to the same line are parallel to each other.

## Try This

(i) Find the measure of the question marked angle in the given figure.
(ii) Find the angles which are equal to $\angle \mathrm{P}$.

Now, let us solve some examples related to parallel lines.

Example-8. In the given figure, $\mathrm{AB} \| \mathrm{CD}$. Find the value af $x$.
Solution : From E , draw $\mathrm{EF}\|\mathrm{AB}\| \mathrm{CD} . \mathrm{EF} \| \mathrm{CD}$ and CE is the transversal.
$\therefore \angle \mathrm{DCE}+\angle \mathrm{CEF}=180^{\circ}[\because$ Co-interior angles $]$
$\Rightarrow \mathrm{x}^{0}+\angle \mathrm{CEF}=180^{\circ} \Rightarrow \angle \mathrm{CEF}=\left(180-\mathrm{x}^{\circ}\right)$.
Again, $\mathrm{EF} \| \mathrm{AB}$ and AE is the transversal.
$\angle \mathrm{BAE}+\angle \mathrm{AEF}=180^{\circ}[\because$ Co-interior angles $]$

$\Rightarrow 105^{\circ}+\angle \mathrm{AEC}+\angle \mathrm{CEF}=180^{\circ}$
$\Rightarrow 105^{\circ}+25^{\circ}+\left(180^{\circ}-x^{\circ}\right)=180^{\circ}$
$\Rightarrow 310-x^{\circ}=180^{\circ}$
Hence, $x=130^{\circ}$.

Example-9. In the adjacent figure, find the value of $x, y, z$ and $a, b, c$.
Solution : Clearly, we have

$$
\begin{aligned}
& \mathrm{y}^{\mathrm{o}}=110^{\circ}(\because \text { Corresponding angles) } \\
& \Rightarrow x^{\circ}+\mathrm{y}^{\mathrm{o}}=180^{\circ} \text { (Linear pair) } \\
& \Rightarrow x^{0}+110^{\circ}=180^{\circ} \\
& \Rightarrow x^{\mathrm{o}}=\left(180^{\circ}-110^{\circ}\right)=70^{\circ} . \\
& \mathrm{z}^{\mathrm{o}}=x^{\circ}=70^{\circ} \quad(\because \text { Corresponding angles) } \\
& \left.\mathrm{c}^{\mathrm{o}}=65^{\circ} \quad \quad \text { (How? }\right) \\
& \mathrm{a}^{\mathrm{o}}+\mathrm{c}^{\mathrm{o}}=180^{\circ} \quad[\text { Linear pair }] \\
& \Rightarrow \mathrm{a}^{\mathrm{o}}+65^{\circ}=180^{\circ} \\
& \Rightarrow \mathrm{a}^{\mathrm{o}}=\left(180^{\circ}-65^{\circ}\right)=115^{\circ} . \\
& \mathrm{b}^{\mathrm{o}}=\mathrm{c}^{\mathrm{o}}=65^{\circ} . \quad[\because \text { Vertically opposite angles }]
\end{aligned}
$$

Hence, $\mathrm{a}=115^{\circ}, \mathrm{b}=65^{\circ}, \mathrm{c}=65^{\circ}, x=70^{\circ}, y=110^{\circ}, \mathrm{z}=70^{\circ}$.
Example 10. In the given figure, lines EF and GH are parallel. Find the value of $x$ if the lines AB and CD are also parallel.

Solution: $\quad 4 x^{\circ}=\angle \mathrm{APR}$ (Why?)

$$
\angle \mathrm{APR}=\angle \mathrm{PQS} \text { (Why?) }
$$

$$
\begin{aligned}
& \angle \mathrm{PQS}+\angle \mathrm{SQB}=180^{\circ}(\mathrm{Why} ?) \\
& 4 x^{\circ}+(3 x+5)^{\circ}=180^{\circ} \\
& 7 x^{\circ}+5^{\circ}=180^{\circ} \\
& x^{\circ}=\frac{180^{\circ}-5^{\circ}}{7} \\
& =25^{\circ}
\end{aligned}
$$

Example-11. In the given figure $\mathrm{PQ} \| \mathrm{RS}, \angle \mathrm{MXQ}=135^{\circ}$ and $\angle \mathrm{MYR}=40^{\circ}$, find $\angle \mathrm{XMY}$.
Solution : Construct a line AB parallel to PQ , through the point M .
Now, $\mathrm{AB} \| \mathrm{PQ}$ and $\mathrm{PQ} \| \mathrm{RS}$.
Therefore, $\quad \mathrm{AB} \| \mathrm{RS}$
Now,

$$
\angle \mathrm{QXM}+\angle \mathrm{XMB}=180^{\circ}
$$

( $\mathrm{AB} \| \mathrm{PQ}$, Interior angles on the same side of the transversal XM)
So, $\quad 135^{\circ}+\angle \mathrm{XMB}=180^{\circ}$

Therefore,
$\angle \mathrm{XMB}=45^{\circ}$
Now, $\quad \angle \mathrm{BMY}=\angle \mathrm{MYR}$ (Alternate interior angles as $\mathrm{AB} \| \mathrm{RS}$ )
Therefore, $\quad \angle B M Y=40^{\circ}$
Adding (1) and (2), you get

$$
\angle \mathrm{XMB}+\angle \mathrm{BMY}=45^{\circ}+40^{\circ}
$$

That is,

$$
\angle \mathrm{XMY}=85^{\circ}
$$

Example-12. If a transversal intersects two lines such that the bisectors of a pair of corresponding angles are parallel, then prove that the two lines are parallel.

Solution : In the given Figure a transversal $\overrightarrow{\mathrm{AD}}$ intersects two lines $\overleftrightarrow{\mathrm{PQ}}$ and $\overrightarrow{\mathrm{RS}}$ at two points B and C respectively. Ray $\overrightarrow{\mathrm{BE}}$ is the bisector of $\angle \mathrm{ABQ}$ and ray $\overrightarrow{\mathrm{CF}}$ is the bisector of $\angle \mathrm{BCS}$; and $\mathrm{BE} \| \mathrm{CF}$.

We have to prove that $\mathrm{PQ} \| \mathrm{RS}$. It is enough to prove any one of the following pair:
i. Corresponding angles are equal.
ii. Pair of interior or exterior angles are equal.
iii. Interior angles same side of the transversal are supplementary.

From the figure, we try to prove the pairs of corresponding angles to be equal.
Since, it is given that ray BE is the bisector of $\angle \mathrm{ABQ}$.

$$
\begin{equation*}
\angle \mathrm{ABE}=\quad \frac{1}{2} \angle \mathrm{ABQ} \tag{1}
\end{equation*}
$$

Similarly, ray CF is the bisector of $\angle \mathrm{BCS}$.
Therefore, $\angle \mathrm{BCF}=\frac{1}{2} \angle \mathrm{BCS}$
But for the parallel lines BE and $\mathrm{CF} ; \overrightarrow{\mathrm{AD}}$ is a transversal.
Therefore, $\angle \mathrm{ABE}=\angle \mathrm{BCF}$
(Corresponding angles axiom)
From the equation (1) and (2) in (3), we get

$$
\begin{array}{rlrl} 
& & \frac{1}{2} \angle \mathrm{ABQ} & =\frac{1}{2} \angle \mathrm{BCS} \\
\therefore & \angle \mathrm{ABQ} & =\angle \mathrm{BCS}
\end{array}
$$

But, these are the corresponding angles made by the transversal $\stackrel{\mathrm{AD}}{ }$ with lines $\overleftrightarrow{\mathrm{PQ}}$ and $\overleftrightarrow{\mathrm{RS}}$; and are equal.

Therefore, $\quad \mathrm{PQ} \| \mathrm{RS} \quad$ (Converse of corresponding angles axiom)
Example-13. In the given figure $\mathrm{AB} \| \mathrm{CD}$ and $\mathrm{CD} \| \mathrm{EF}$. Also $\mathrm{EA} \perp \mathrm{AB}$. If $\angle \mathrm{BEF}=55^{\circ}$, find the values of $x, y$ and $z$.

Solution : Extend BE to G.
Now $\angle \mathrm{GEF}=180^{\circ}-55^{\circ}$ (Why?)

$$
=125^{\circ}
$$

```
Also \(\angle \mathrm{GEF}=x=y=125^{\circ}\) (Why?)
Now \(z=90^{\circ}-55^{\circ}\) (Why?)
    \(=35^{\circ}\)
```

Different ways to prove that two lines are parallel.

1. Showing a pair of corresponding angles are equal.
2. Showing a pair of alternate interior angles are equal.
3. Showing a pair of interior angles on the same side of the transversal are supplementary.
4. In a plane, showing both lines are $\perp$ to the same line.
5. Showing both lines are parallel to a third line.

## Exercise - 4.3

1. It is given that $l \| m$ to prove $\angle 1$ is supplement to $\angle 8$. Write reasons for the statement.

## Statement

Reasons
i. $l \| m$ $\qquad$
ii. $\quad \angle 1=\angle 5$
iii. $\angle 5+\angle 8=180^{\circ}$ $\qquad$
iv. $\angle 1+\angle 8=180^{\circ}$ $\qquad$
v. $\angle 1$ is supplement to $\angle 8$ $\qquad$

2. In the adjacent figure $\mathrm{AB}\|\mathrm{CD} ; \mathrm{CD}\| \mathrm{EF}$ and $y: z=3: 7$, find $x$.

3. In the adjacent figure $\mathrm{AB} \| \mathrm{CD}, \mathrm{EF} \perp \mathrm{CD}$ and $\angle \mathrm{GED}=126^{\circ}$, find $\angle \mathrm{AGE}, \angle \mathrm{GEF}$ and $\angle \mathrm{FGE}$.
4. In the adjacent figure $\mathrm{PQ} \| \mathrm{ST}, \angle \mathrm{PQR}$ $=110^{\circ}$ and $\angle \mathrm{RST}=130^{\circ}$, find $\angle \mathrm{QRS}$.
[Hint : Draw a line parallel to ST through point R.]
5. In the adjacent figure $m \| n$. A, B are any two points on $m$ and $n$ respectively. Let ' $C$ ' be an interior, point between the lines $m$ and $n$. Find $\angle A C B$.

6. Find the value of $a$ and $b$, given that $p \| \mathrm{q}$ and $r \| s$.

7. If in the figure $a \| b$ and $c \| d$, then name the angles that are congruent to (i) $\angle 1$ (ii) $\angle 2$.

8. In the figure the arrow head segments are parallel. find the value of $x$ and $y$.

10. Find the value of $x$ and $y$ from the figure.
11. From the figure find $x$ and $y$.
12. Draw figures for the following statement.

"If the two arms of one angle are respectively perpendicular to the two arms of another angle then the two angles are either equal or supplementary".
13. In the given figure, if $\mathrm{AB} \| \mathrm{CD}, \angle \mathrm{APQ}=50^{\circ}$ and $\angle P R D=127^{\circ}$, find $x$ and $y$.

14. In the adjacent figure PQ and RS are two mirrors placed parallel to each other. An incident ray $\overrightarrow{\mathrm{AB}}$ strikes the mirror PQ at B , the reflected ray moves along the path $\overrightarrow{\mathrm{BC}}$ and strikes the mirror RS at C and again reflected back along $\overrightarrow{\mathrm{CD}}$. Prove that
 AB || CD.
[Hint : Perpendiculars drawn to parallel lines are also parallel.]
15. In the figures given below $\mathrm{AB} \| \mathrm{CD}$. EF is the transversal intersecting AB and CD at G and H respectively. Find the values of $x$ and $y$. Give reasons

17. In the adjacent figure $\mathrm{AB} \| \mathrm{CD}$. Find the value of $x, y$ and $z$.

18. In the adjacent figure $\mathrm{AB} \| \mathrm{CD}$. Find the values of $\mathrm{x}, \mathrm{y}$ and z .
19. In each of the following figures $\mathrm{AB} \| \mathrm{CD}$. Find the value of $x$ in each case.

(ii)

### 4.5 Angle Sum Property of a Triangle

Let us now prove that the sum of the interior angles of a triangle is $180^{\circ}$.

## Activity

- Draw and cut out a large triangle as shown in the figure.
- Number the angles and tear them off.
- Place the three angles adjacent to each other to form
 one angle. as shown at the right.

1. Identify angle formed by the three adjacent angles? What is its measure?
2. Write about the sum of the measures of the angles of a
 triangle.

Now let us prove this statement using the axioms and theorems related to parallel lines.

Theorem-4.6 : The sum of the angles of a triangle is $180^{\circ}$.
Given : ABC is a triangle.
R.T.P. : $\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}$

Construction : Produce BC to a point D
Through ' $C$ ' draw a line CE parallel to BA

## Proof:

```
\(\mathrm{BA} \mid \mathrm{CE}\)
\(\angle \mathrm{ABC}=\angle \mathrm{ECD} . . .\). (1)
\(\angle \mathrm{BAC}=\angle \mathrm{ACE} . . .\). .(2)
\(\angle \mathrm{ACB}=\angle \mathrm{ACB} . . .\). (3)
\(\angle \mathrm{ABC}+\angle \mathrm{BAC}+\angle \mathrm{ACB}=\)
\(\angle \mathrm{ECD}+\angle \mathrm{ACE}+\angle \mathrm{ACB}\)
But \(\angle \mathrm{ECD}+\angle \mathrm{ACE}+\angle \mathrm{ACB}=180^{\circ} \quad\) [angles on a straight line]
\(\therefore \angle \mathrm{ABC}+\angle \mathrm{BAC}+\angle \mathrm{ACB}=180^{\circ}\)
\(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}\)
```

[By construction]
[By corresponding angles axiom.]
[Alternate interior angles for the parallel lines

## AB and CE]

[Same angle]
[Adding the above three equations]
[angles on a straight line]

```
\(\therefore \angle \mathrm{ABC}+\angle \mathrm{BAC}+\angle \mathrm{ACB}=180^{\circ}\)
\(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}\)
```

You know that when a side of a triangle is produced there forms an exterior angle of the triangle

When side QR is produced to point $\mathrm{S}, \angle \mathrm{PRS}$ is called an exterior angle of $\triangle \mathrm{PQR}$.

$$
\begin{equation*}
\text { Is } \angle \mathrm{PRQ}+\angle \mathrm{PRS}=180^{\circ} ?(\text { Why? }) \tag{1}
\end{equation*}
$$

Also, see that

$\angle \mathrm{PRQ}+\angle \mathrm{PQR}+\angle \mathrm{QPR}=180^{\circ}$ (Why? $)$
From (1) and (2), we can see that $\angle \mathrm{PRQ}+\angle \mathrm{PRS}=\angle \mathrm{PRQ}+\angle \mathrm{PQR}+\angle \mathrm{QPR}$

$$
\therefore \angle \mathrm{PRS}=\angle \mathrm{PQR}+\angle \mathrm{QPR}
$$

This result can be stated in the form of a theorem as given below
Theorem-4.7 : If a side of a triangle is produced, then the exterior angle so formed is equal to the sum of the two interior opposite angles.

It is obvious from the above theorem that an exterior angle of a triangle is always greater than either of its interior opposite angles.

Now, let us solve some examples based on the above

## Think, Discuss and Write

If the sides of a triangle are produced in order, what will be the sum of exterior angles formed?

Example-14. The angle of a triangle are $(2 x)^{\circ},(3 x+5)^{\circ}$ and $(4 x-14)^{\circ}$.
Find the value of $x$ and the measure of each angle of the triangle.
Solution : We know that the sum of the angles of a triangle is $180^{\circ}$.

$$
\begin{aligned}
& \therefore 2 x^{\circ}+3 x^{\circ}+5^{\circ}+4 x^{\circ}-14^{\circ}=180^{\circ} \Rightarrow 9 x^{\circ}-9^{\circ}=180^{\circ} \\
& \Rightarrow 9 x^{\circ}=180^{\circ}+9^{\circ}=189^{\circ} \\
& \Rightarrow x=\frac{189^{\circ}}{9^{\circ}}=21 . \\
& \therefore 2 x^{\circ}=(2 \times 21)^{\circ}=42^{\circ},(3 x+5)^{\circ}=[(3 \times 21+5)]^{\circ}=68^{\circ} . \\
&(4 x-14)^{\circ}=[(4 \times 21)-14]^{\circ}=70^{\circ}
\end{aligned}
$$

Hence, the angles of the triangle are $42^{\circ}, 68^{\circ}$ and $70^{\circ}$.

Example-15. In the adjacent figure, $\mathrm{AB} \| \mathrm{QR}, \angle \mathrm{BAQ}=142^{\circ}$ and $\angle \mathrm{ABP}=100^{\circ}$.
Find (i) $\angle \mathrm{APB}$ (ii) $\angle \mathrm{AQR}$ and (iii) $\angle \mathrm{QRP}$,
Solution: (i) Let $\angle \mathrm{APB}=x^{\circ}$,
Side $P A$ of $\triangle P A B$ is produced to $Q$.
$\therefore$ Exterior angle $\angle \mathrm{BAQ}=\angle \mathrm{ABP}+\angle \mathrm{APB}$
$\Rightarrow 142^{\circ}=100^{\circ}+x^{0}$
$\Rightarrow x^{\circ}=\left(142^{\circ}-100^{\circ}\right)=42^{\circ}$.
$\therefore \angle \mathrm{APB}=42^{\circ}$,
(ii) Now, $\mathrm{AB} \| \mathrm{QR}$ and PQ is a transversal.
$\therefore \angle \mathrm{BAQ}+\angle \mathrm{AQR}=180^{\circ}$ [Sum of co-interior angles is $180^{\circ}$ ]
$\Rightarrow \quad 142^{\circ}+\angle \mathrm{AQR}=180^{\circ}$,
$\therefore \angle \mathrm{AQR}=\left(180^{\circ}-142^{\circ}\right)=38^{\circ}$.
(iii) Since $A B \| Q R$ and $P R$ is a transversal.
$\angle \mathrm{QRP}=\angle \mathrm{ABP}=100^{\circ} \quad$ [Corresponding angles]

Example-16. Using information given in the adjacent figure, find the value of $x$.

Solution : In the given figure, ABCD is a quadrilateral. Let us try to make it as two triangles.

Join AC and produce it to E .

Let $\angle \mathrm{DAE}=\mathrm{p}^{\circ}, \angle \mathrm{BAE}=\mathrm{q}^{\circ}, \angle \mathrm{DCE}=\mathrm{z}^{\circ}$ and $\angle \mathrm{ECB}=\mathrm{t}^{\circ}$. Since the exterior angle of a triangle is equal to the sum of the interior opposite angles, we have :
$z^{\circ}=p^{\circ}+26^{\circ}$
$t^{\circ}=q^{\circ}+38^{\circ}$
$\therefore z^{\circ}+t^{\circ}=p^{\circ}+q^{\circ}+(26+38)^{\circ}=p^{\circ}+q^{\circ}+64^{\circ}$
But, $p^{\circ}+q^{\circ}=46 . \quad\left(\because \angle \mathrm{DAB}=46^{\circ}\right)$
So, $z^{\circ}+t^{\circ}=46+64=110^{\circ}$.

Hence $x^{\circ}=z^{\circ}+t^{\circ}=110^{\circ}$.

Example-17. In the given figure $\angle \mathrm{A}=40^{\circ}$. If $\overrightarrow{\mathrm{BO}}$ and $\overrightarrow{\mathrm{CO}}$ are the bisectors of $\angle \mathrm{B}$ and $\angle$ C respectively. Find the measure of $\angle \mathrm{BOC}$.

Solution : We know that BO is the bisector of $\angle \mathrm{B}$ and CO is the bisector of $\angle \mathrm{C}$.
Let $\angle \mathrm{CBO}=\angle \mathrm{ABO}=x^{\circ}$ and $\angle \mathrm{BCO}=\angle \mathrm{ACO}=y^{\circ}$.
Then, $\angle \mathrm{B}=(2 x)^{\circ}, \angle \mathrm{C}=(2 \mathrm{y})^{\circ}$ and $\angle \mathrm{A}=40^{\circ}$.
But, $\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}$. (How?)
$2 x^{\circ}+2 y^{\circ}+40^{\circ}=180^{\circ}$
$\Rightarrow 2(x+y)^{\circ}=140^{\circ}$
$=x^{\circ}+y^{\circ}=\frac{140^{\circ}}{2}=70^{\circ}$.

Hence, $\angle \mathrm{BOC}=180^{\circ}-70^{\circ}=110^{\circ}$.
Example-18. Using information given in the adjacent figure, find the values of $x$ and $y$.
Solution : Side $B C$ of $\triangle A B C$ has been produced to $D$.
Exterior $\angle \mathrm{ACD}=\angle \mathrm{ABC}+\angle \mathrm{BAC}$
$\therefore 100^{\circ}=65^{\circ}+x^{\circ}$
$\Rightarrow x^{0}=\left(100^{\circ}-65^{\circ}\right)=35^{\circ}$.
$\therefore \angle \mathrm{CAD}=\angle \mathrm{BAC}=35^{\circ}$

In $\triangle A C D$, we have :

$$
\begin{aligned}
& \angle \mathrm{CAD}+\angle \mathrm{ACD}+\angle \mathrm{CDA}=180^{\circ} \text { (Angle sum property of triangle) } \\
& \quad \Rightarrow 35^{\circ}+100^{\circ}+y^{\circ}=180^{\circ} \\
& \quad \Rightarrow 135^{\circ}+y^{\circ}=180^{\circ} \\
& \quad \Rightarrow y^{\circ}=\left(180^{\circ}-135^{\circ}\right)=45^{\circ}
\end{aligned}
$$

Hence, $x=35^{\circ}, y=45^{\circ}$.
Example-19. Using information given in the adjacent figure, find the value of x and y .
Solution : Side BC of $\triangle A B C$ has been produced to $D$.
$\therefore$ Exterior angle $\angle \mathrm{ACD}=\angle \mathrm{BAC}+\angle \mathrm{ABC}$
$\Rightarrow \quad x^{\circ}=30^{\circ}+35^{\circ}=65^{\circ}$.
Again, side CE of $\triangle \mathrm{DCE}$ has produced to A .
$\therefore$ Exterior angle $\angle \mathrm{DEA}=\angle \mathrm{EDC}+\angle \mathrm{ECD}$

$\Rightarrow \quad y=45+x^{\circ}=45^{\circ}+65^{\circ}=110^{\circ}$.
Hence, $x=65^{\circ}$ and $\mathrm{y}=110^{\circ}$.
Example-20. In the adjacent fig. if $\mathrm{QT} \perp \mathrm{PR}, \angle \mathrm{TQR}=40^{\circ}$ and $\angle \mathrm{SPR}=30^{\circ}$, find $x$ and $y$.
Solution: In $\triangle T Q R$,

$$
90^{\circ}+40^{\circ}+x=180^{\circ} \text { (Angle sum property of a triangle) }
$$

Therefore, $\quad x^{\circ}=50^{\circ}$
Now,

$$
y^{\circ}=\angle \mathrm{SPR}+x^{\circ}(\text { Exterior angle of traingle })
$$

Therefore,

$$
\begin{aligned}
y^{\circ} & =30^{\circ}+50^{\circ} \\
& =80^{\circ}
\end{aligned}
$$

Example-21. In the adjacent figure the sides AB and AC of $\triangle \mathrm{ABC}$ are produced to points E and D respectively. If bisectors BO and CO of $\angle \mathrm{CBE}$ and $\angle \mathrm{BCD}$ respectively meet at point O , then prove that $\angle \mathrm{BOC}=90^{\circ}-\frac{1}{2} \angle \mathrm{BAC}$.
Solution : Ray BO is the bisector of $\angle \mathrm{CBE}$.
Therefore, $\angle \mathrm{CBO}=\frac{1}{2} \angle \mathrm{CBE}$

$$
\begin{align*}
& =\frac{1}{2}\left(180^{\circ}-y^{\circ}\right) \\
& =90^{\circ}-\frac{y^{\circ}}{2} \tag{1}
\end{align*}
$$

Similarly, ray CO is the bisector of $\angle \mathrm{BCD}$.
Therefore, $\angle \mathrm{BCO}=\frac{1}{2} \angle \mathrm{BCD}$

$$
\begin{align*}
& =\frac{1}{2}\left(180^{\circ}-z^{\circ}\right) \\
& =90^{\circ}-\frac{z^{\circ}}{2} \tag{2}
\end{align*}
$$

In $\triangle \mathrm{BOC}, \angle \mathrm{BOC}+\angle \mathrm{BCO}+\angle \mathrm{CBO}=180^{\circ}$
Substituting (1) and (2) in (3), you get

$$
\angle \mathrm{BOC}+90^{\circ}-\frac{z^{\circ}}{2}+90^{\circ}-\frac{y^{\circ}}{2}=180^{\circ}
$$

So, $\quad \angle \mathrm{BOC}=\frac{z^{\circ}}{2}+\frac{y^{\circ}}{2}$
or, $\quad \angle \mathrm{BOC}=\frac{1}{2}\left(y^{\circ}+z^{\circ}\right)$

But, $x^{\circ}+y^{\circ}+z^{\circ}=180^{\circ}$ (Angle sum property of a triangle)
Therefore, $\quad y^{\circ}+z^{\circ}=180^{\circ}-x^{\circ}$
Therefore, (4) becomes

$$
\begin{aligned}
\angle \mathrm{BOC} & =\frac{1}{2}\left(180^{\circ}-x\right)^{\circ} \\
& =90^{\circ}-\frac{x^{\circ}}{2} \\
& =90^{\circ}-\frac{1}{2} \angle \mathrm{BAC}
\end{aligned}
$$

## Exercise 4.4

1. In the given triangles, find out $\angle x, \angle y$ and $\angle z$.

2. In the given figure $\mathrm{AS} \| \mathrm{BT} ; \angle 4=\angle 5$
$\overrightarrow{\mathrm{SB}}$ bisects $\angle \mathrm{AST}$. Find the measure of $\angle 1$

3. In the adjacent figure $\mathrm{BE} \perp \mathrm{DA}$ and $\mathrm{CD} \perp \mathrm{DA}$ then prove that $m \angle 1 \cong m \angle 3$.

4. and BC become parallel.

5. In the given figure segments shown by arrow heads are parallel. Find the values of $x$ and $y$.

6. In the given figure sides QP and RQ of $\angle \mathrm{PQR}$ are produced to points S and T respectively. If $\angle \mathrm{SPR}=135^{\circ}$ and $\angle \mathrm{PQT}$ $=110^{\circ}$, find $\angle \mathrm{PRQ}$.
7. In the given figure, $\angle X=62^{\circ}, \angle X Y Z=54^{\circ}$. In $\triangle X Y Z$ If YO and ZO are the bisectors of $\angle \mathrm{XYZ}$ and $\angle \mathrm{XZY}$ respectively find $\angle \mathrm{OZY}$ and $\angle \mathrm{YOZ}$.

8. In the given figure if $\mathrm{AB} \| \mathrm{DE}, \angle \mathrm{BAC}=35^{\circ}$ and

9. In the given figure if line segments $P Q$ and RS intersect at point T , such that $\angle \mathrm{PRT}=40^{\circ}, \quad \angle \mathrm{RPT}=95^{\circ}$ and $\angle \mathrm{TSQ}=75^{\circ}$, find $\angle \mathrm{SQT}$.
10. In the adjacent figure, ABC is a triangle in which $\angle B=50^{\circ}$ and $\angle C=70^{\circ}$. Sides $A B$ and $A C$ are produced. If ' $z$ ' is the measure of the angle between the bisectors of the exterior angles so formed, then find ' $z$ '.

11. In the given figure if $\mathrm{PQ} \perp \mathrm{PS}, \mathrm{PQ} \| \mathrm{SR}$, $\angle \mathrm{SQR}=28^{\circ}$ and $\angle \mathrm{QRT}=65^{\circ}$, then find the values of $x$ and $y$.
12. In the given figure $\triangle \mathrm{ABC}$ side AC has been produced to $\mathrm{D} . \angle \mathrm{BCD}=125^{\circ}$ and $\angle \mathrm{A}: \angle \mathrm{B}=2: 3$, find the measure of $\angle \mathrm{A}$ and $\angle \mathrm{B}$.

13. In the adjacent figure, $i t$ is given that, $\mathrm{BC} \| \mathrm{DE}$, $\angle \mathrm{BAC}=35^{\circ}$ and $\angle \mathrm{BCE}=102^{\circ}$. Find the measure of(i) $\angle \mathrm{BCA}$ (ii) $\angle \mathrm{ADE}$ and (iii) $\angle \mathrm{CED}$.
14. In the adjacent figure, it is given that $\mathrm{AB}=\mathrm{AC}, \angle \mathrm{BAC}=36^{\circ}, \angle \mathrm{ADB}=45^{\circ}$ and $\angle \mathrm{AEC}=40^{\circ}$. Find (i) $\angle \mathrm{ABC}$ (ii) $\angle \mathrm{ACB}$ (iii) $\angle \mathrm{DAB}$ (iv) $\angle \mathrm{EAC}$.

15. Using information given in the figure, calculate the value of $x$ and $y$.

## What we have discussed

- Linear pair axiom: If a ray stands on a straight line, then the sum of the two adjacent angles so formed is $180^{\circ}$.
- Converse of linear pair axiom:

If the sum of two adjacent angles is $180^{\circ}$, then the non-common arms of the angles form a line.

- Theorem: If two lines intersect each other, then the vertically opposite angles are equal.
- Axiom of corresponding angles: If a transversal intersects two parallel lines, then each pair of corresponding angles are equal.
- Theorem: If a transversal intersects two parallel lines, then each pair of alternate interior angles are equal.
- Theorem: If a transversal intersects two parallel lines, then each pair of interior angles on the same side of the transversal are supplementary.
- Converse of axiom of corresponding angles:

If a transversal intersects two lines such that a pair of corresponding angles are equal, then the two lines are parallel to each other.

- Theorem: If a transversal intersects two lines such that a pair of alternate interior angles are equal, then the two lines are parallel.
- Theorem: If a transversal intersects two lines such that a pair of interior angles on the same side of the transversal are supplementary, then the two lines are parallel.
- Theorem: Lines which are parallel to a given line are parallel to each other.
- Theorem: The sum of the angles of a triangle is $180^{\circ}$.
- Theorem: If a side of a triangle is produced, then the exterior angle so formed is equal to the sum of the two interior opposite angles.
