Exercise 11.1 Page: 191

1. Construct an angle of 90° at the initial point of a given ray and justify the construction.

Construction Procedure:

To construct an angle 90°, follow the given steps:

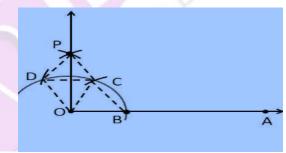

- 1. Draw a ray OA
- 2. Take O as a centre with any radius, draw an arc DCB is that cuts OA at B.
- 3. With B as a centre with the same radius, mark a point C on the arc DCB.
- 4. With C as a centre and the same radius, mark a point D on the arc DCB.
- 5. Take C and D as centre, draw two arcs which intersect each other with the same radius at P.
- 6. Finally, the ray OP is joined which makes an angle 90° with OP is formed.

Justification

To prove $\angle POA = 90^{\circ}$

In order to prove this draw a dotted line from the point O to C and O to D and the angles formed are:

From the construction, it is observed that

OB = BC = OC

Therefore OBC is an equilateral triangle

So that, $\angle BOC = 60^{\circ}$.

Similarly,

OD = DC = OC

Therefore DOC is an equilateral triangle

So that, $\angle DOC = 60^{\circ}$.

From SSS triangle congruence rule

 \triangle OBC \cong OCD

∠BOC= ∠DOC

Therefore, $\angle COP = \frac{1}{2} \angle DOC = \frac{1}{2} (60^{\circ})$.

 $\angle COP = 30^{\circ}$

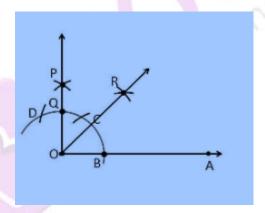

To find the $\angle POA = 90^{\circ}$: $\angle POA = \angle BOC + \angle COP$ $\angle POA = 60^{\circ} + 30^{\circ}$ $\angle POA = 90^{\circ}$ Hence, justified.

2. Construct an angle of 45° at the initial point of a given ray and justify the construction.

Construction Procedure:

- 1. Draw a ray OA
- 2. Take O as a centre with any radius, draw an arc DCB is that cuts OA at B.
- 3. With B as a centre with the same radius, mark a point C on the arc DCB.
- 4. With C as a centre and the same radius, mark a point D on the arc DCB.
- 5. Take C and D as centre, draw two arcs which intersect each other with the same radius at P.
- 6. Finally, the ray OP is joined which makes an angle 90° with OP is formed.
- 7. Take B and Q as centre draw the perpendicular bisector which intersects at the point R
- 8. Draw a line that joins the point O and R
- 9. So, the angle formed $\angle ROA = 45^{\circ}$

Justification

From the construction,

$$\angle POA = 90^{\circ}$$

From the perpendicular bisector from the point B and Q, which divides the ∠POA into two halves. So it becomes

 $\angle ROA = 1/2 \angle POA$

$$\angle ROA = 1/2 \times 90^{\circ} = 45^{\circ}$$

Hence, justified

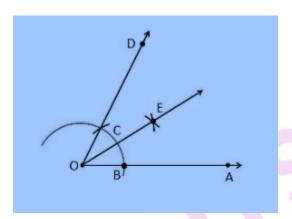

3. Construct the angles of the following measurements:

(i)
$$30^{\circ}$$
 (ii) $22\frac{1^{\circ}}{2}$

Solution:

(i) 30°

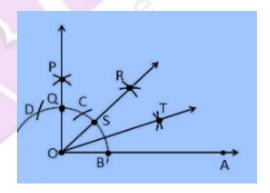

- 1. Draw a ray OA
- 2. Take O as a centre with any radius, draw an arc BC which cuts OA at B.
- 3. With B and C as centres, draw two arcs which intersect each other at the point E and the perpendicular bisector is drawn.
- 4. Thus, ∠EOA is the required angle making 30° with OA.

(ii) $22\frac{1^{\circ}}{2}$

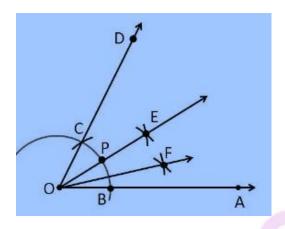

Construction Procedure:

- 1. Draw an angle $\angle POA = 90^{\circ}$
- 2. Take O as a centre with any radius, draw an arc BC which cuts OA at B and OP at Q
- 3. Now, draw the bisector from the point B and Q where it intersect at the point R such that it makes an angle $\angle ROA = 45^{\circ}$.
- 4. Again, ∠ROA is bisected such that ∠TOA is formed which makes an angle of 22.5° with OA

(iii) 15°

- 1. An angle $\angle DOA = 60^{\circ}$ is drawn.
- 2. Take O as centre with any radius, draw an arc BC which cuts OA at B and OD at C
- 3. Now, draw the bisector from the point B and C where it intersect at the point E such that it makes an angle $\angle EOA = 30^{\circ}$.
- 4. Again, ∠EOA is bisected such that ∠FOA is formed which makes an angle of 15° with OA.
- 5. Thus, ∠FOA is the required angle making 15° with OA.

4. Construct the following angles and verify by measuring them by a protractor:

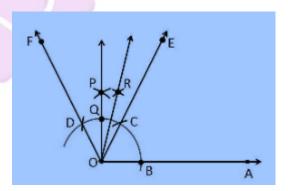

(i) 75° (ii) 105° (iii) 135°

Solution:

(i) 75°

Construction Procedure:

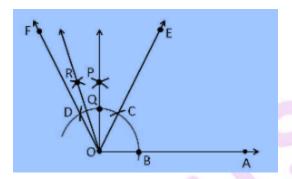

- 1. A ray OA is drawn.
- 2. With O as centre draw an arc of any radius and intersect at the point B on the ray OA.
- 3. With B as centre draw an arc C and C as centre draw an arc D.
- 4. With D and C as centre draw an arc, that intersect at the point P.
- 5. Join the points O and P
- 6. The point that arc intersect the ray OP is taken as Q.
- 7. With Q and C as centre draw an arc, that intersect at the point R.
- 8. Join the points O and R
- 9. Thus, $\angle AOE$ is the required angle making 75° with OA.

(ii) 105°

- 1. A ray OA is drawn.
- 2. With O as centre draw an arc of any radius and intersect at the point B on the ray OA.
- 3. With B as centre draw an arc C and C as centre draw an arc D.

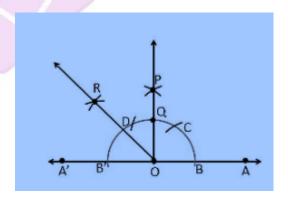

- 4. With D and C as centre draw an arc, that intersect at the point P.
- 5. Join the points O and P
- 6. The point that arc intersect the ray OP is taken as Q.
- 7. With Q and Q as centre draw an arc, that intersect at the point R.
- 8. Join the points O and R
- 9. Thus, ∠AOR is the required angle making 105° with OA.

(iii) 135°

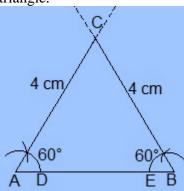

Construction Procedure:

- 1. Draw a line AOA'
- 2. Draw an arc of any radius that cuts the line AOA' at the point B and B'
- 3. With B as centre, draw an arc of same radius at the point C.
- 4. With C as centre, draw an arc of same radius at the point D
- 5. With D and C as centre, draw an arc that intersect at the point O
- 6. Join OP
- 7. The point that arc intersect the ray OP is taken as Q and it forms an angle 90°
- 8. With B' and Q as centre, draw an arc that intersects at the point R
- 9. Thus, ∠AOR is the required angle making 135° with OA.

5. Construct an equilateral triangle, given its side and justify the construction.

- 1. Let draw a line segment AB=4 cm.
- 2. With A and B as centres, draw two arcs on the line segment AB and note the point as D and E.
- 3. With D and E as centres, draw the arcs that cuts the previous arc respectively that forms an angle of 60° each.
- 4. Now, draw the lines from A and B that are extended to meet each other at the point C.
- 5. Therefore, ABC is the required triangle.

Justification:

From construction, it is observed that

$$AB = 4 \text{ cm}$$
, $\angle A = 60^{\circ} \text{ and } \angle B = 60^{\circ}$

We know that, the sum of the interior angles of a triangle is equal to 180°

$$\angle A + \angle B + \angle C = 180^{\circ}$$

SuBstitute the values

$$\Rightarrow$$
 60° + 60° + \angle C = 180°

$$\Rightarrow 120^{\circ} + \angle C = 180^{\circ}$$

$$\Rightarrow \angle C = 60^{\circ}$$

While measuring the sides, we get

BC = CA = 4 cm (Sides opposite to equal angles are equal)

$$AB = BC = CA = 4 \text{ cm}$$

$$\angle A = \angle B = \angle C = 60^{\circ}$$

Hence, justified.

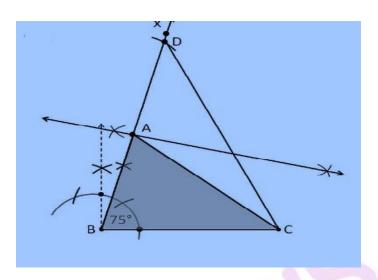

Exercise 11.2

Page: 195

1. Construct a triangle ABC in which BC = 7cm, $\angle B = 75^{\circ}$ and AB + AC = 13 cm.

Construction Procedure:

- 1. Draw a line segment of base BC = 7 cm
- 2. Measure and draw $\angle B = 75^{\circ}$ and draw the ray BX
- 3. Take a compass and measure AB + AC = 13 cm.
- 4. With B as centre and draw an arc at the point be D
- 5. Join DC
- 6. Now draw the perpendicular bisector of the line BD and the intersection point is taken as A.
- 7. Now join AC
- 8. Therefore, ABC is the required triangle.

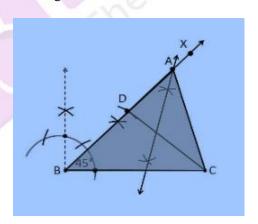

2. Construct a triangle ABC in which BC = 8cm, $\angle B = 45^{\circ}$ and AB - AC = 3.5 cm.

Construction Procedure:

The steps to draw the triangle of given measurement is as follows:

- 1. Draw a line segment of base BC = 8 cm
- 2. Measure and draw $\angle B = 45^{\circ}$ and draw the ray BX
- 3. Take a compass and measure AB AC = 3.5 cm.
- 4. With B as centre and draw an arc at the point be D on the ray BX
- 5. Join DC
- 6. Now draw the perpendicular bisector of the line CD and the intersection point is taken as A.
- 7. Now join AC
- 8. Therefore, ABC is the required triangle.

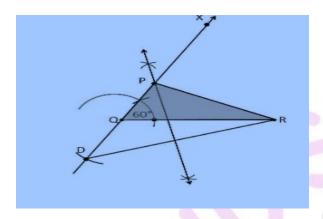

3. Construct a triangle PQR in which QR = 6cm, $\angle Q = 60^{\circ}$ and PR - PQ = 2cm.

Construction Procedure:

- 1. Draw a line segment of base QR = 6 cm
- 2. Measure and draw $\angle Q = 60^{\circ}$ and let the ray be QX
- 3. Take a compass and measure PR PQ = 2cm.
- 4. Since PR PQ is negative, QD will below the line QR.

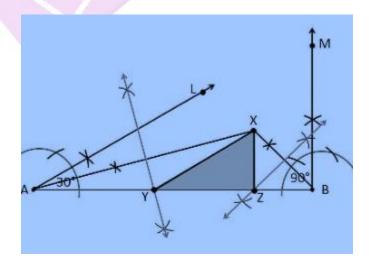

- 5. With Q as centre and draw an arc at the point be D on the ray QX
- 6. Join DR
- 7. Now draw the perpendicular bisector of the line DR and the intersection point is taken as P.
- 8. Now join PR
- 9. Therefore, PQR is the required triangle.

4. Construct a triangle XYZ in which $\angle Y = 30^{\circ}$, $\angle Z = 90^{\circ}$ and XY + YZ + ZX = 11 cm.

Construction Procedure:

- 1. Draw a line segment AB which is equal to XY + YZ + ZX = 11 cm.
- 2. Make an angle $\angle Y = 30^{\circ}$ from the point A and the angle be $\angle LAB$
- 3. Make an angle $\angle Z = 90^{\circ}$ from the point B and the angle be $\angle MAB$
- 4. Bisect \angle LAB and \angle MAB at the point X.
- 5. Now take the perpendicular bisector of the line XA and XB and the intersection point be Y and Z respectively.
- 6. Join XY and XZ
- 7. Therefore, XYZ is the required triangle

5. Construct a right triangle whose base is 12cm and sum of its hypotenuse and other side is 18 cm.

Construction Procedure:

- 1. Draw a line segment of base BC = 12 cm
- 2. Measure and draw $\angle B = 90^{\circ}$ and draw the ray BX
- 3. Take a compass and measure AB + AC = 18 cm.
- 4. With B as centre and draw an arc at the point be D on the ray BX
- 5. Join DC
- 6. Now draw the perpendicular bisector of the line CD and the intersection point is taken as A.
- 7. Now join AC
- 8. Therefore, ABC is the required triangle.
