

**Exercise 2C**

Page No: 59

**QUESTION 1:** If one zero of the polynomial  $x^2 - 4x + 1$  is  $(2 + \sqrt{3})$ , write the other zero.**SOLUTION:**Given:  $(2 + \sqrt{3})$  is one of zero of polynomial  $x^2 - 4x + 1$ .

To find: Other zero

Since given polynomial is a quadratic so it has only two zeros.

Let other zero be  $x$ .

Now,

Sum of zeros =  $-(\text{coefficient of } x)/(\text{coefficient of } x^2)$ 

$$x + (2 + \sqrt{3}) = -(-4/1) = 4$$

$$x + 2 + \sqrt{3} = 4$$

$$\text{or } x = 2 - \sqrt{3}$$

Hence, the other zero is  $(2 - \sqrt{3})$ .**QUESTION 2:** Find the zeros of the polynomial  $x^2 + x - p(p + 1)$ .**SOLUTION:**

$$\text{Let } f(x) = x^2 + x - p(p + 1)$$

Above polynomial can be written as,

$$= x^2 + (p + 1)x - px - p(p + 1)$$

$$= x(x + (p + 1)) - p(x + (p + 1))$$

$$= (x - p)(x + (p + 1))$$

To find the zeroes of  $f(x)$ , put  $f(x) = 0$ 

$$(x - p)(x + (p + 1)) = 0$$

either  $(x - p) = 0$  or  $(x + (p + 1)) = 0$

$x = p$  or  $x = -(p + 1)$

Hence, the zeros of the given polynomial are  $p$  and  $-(p + 1)$

**QUESTION 3**

**Find the zeros of the polynomial  $x^2 - 3x - m(m + 3)$ .**

**SOLUTION:**

Let  $f(x) = x^2 - 3x - m(m + 3)$

Above polynomial can be written as,

$$f(x) = x^2 - (m + 3)x + mx - m(m + 3)$$

$$= x(x - m - 3) + m(x - m - 3)$$

$$= (x - m - 3)(x + m)$$

To find the zeroes of  $f(x)$ , put  $f(x) = 0$

$$(x - m - 3)(x + m) = 0$$

Either  $x - m - 3 = 0$  or  $x + m = 0$

$$x = m + 3 \text{ or } x = -m$$

Required Zeros are  $(m + 3)$ ,  $-m$

**QUESTION 4**

**Find  $\alpha$ ,  $\beta$  are the zeros of a polynomial such that  $\alpha + \beta = 6$  and  $\alpha\beta = 4$  then write the polynomial.**

**SOLUTION:**

Given :  $\alpha + \beta = 6 =$  sum of zeros and

$\alpha\beta = 4 =$  Product of zeroes

We know that, if  $\alpha$  and  $\beta$  are the zeros of the polynomial then the quadratic polynomial can be  $x^2 - (\alpha + \beta)x + \alpha\beta$

Now substituting the values, we get

$x^2 - 6x + 4$ , which is required polynomial.

**QUESTION 5**

If one zero of the quadratic polynomial  $kx^2 + 3x + k$  is 2 then find the value of  $k$ .

**SOLUTION:**

Given: 2 is one of zeroes of the polynomial  $kx^2 + 3x + k$ , which means  $x = 2$  will satisfy it.

$$k(2)^2 + 3(2) + k = 0$$

$$4k + 6 + k = 0$$

$$5k + 6 = 0$$

$$k = -6/5$$

The value of  $k$  is  $-6/5$

**QUESTION 6**

If 3 is a zero of the polynomial  $2x^2 + x + k$ , find the value of  $k$ .

**SOLUTION:**

Given: 3 is one of zeroes of the polynomial  $2x^2 + x + k$ , which means  $x = 3$  will satisfy it.

$$2x^2 + x + k = 0$$

$$2(3)^2 + 3 + k = 0$$

$$18 + 3 + k = 0$$

$$k = -21$$

the value of  $k$  is  $-21$

**QUESTION 7**

If  $-4$  is a zero of the polynomial  $x^2 - x - (2k + 2)$  then find the value of  $k$ .

**SOLUTION:**

Given:  $-4$  is one of zeroes of the polynomial  $x^2 - x - (2k + 2)$ , which means  $x = -4$  will satisfy it.

$$x^2 - x - (2k + 2) = 0$$

$$(-4)^2 - (-4) - 2k - 2 = 0$$

$$16 + 4 - 2k - 2 = 0$$

$$-2k + 18 = 0$$

$$k = 9$$

The value of  $k$  is 9.

**QUESTION 8**

If 1 is a zero of the polynomial  $ax^2 - 3(a - 1)x - 1$  then find the value of  $a$ .

**SOLUTION:**

Given: 1 is one of zeroes of the polynomial  $ax^2 - 3(a - 1)x - 1$ , which means  $x = 1$  will satisfy it.

$$a(1)^2 - 3(a - 1)x - 1 = 0$$

$$a - 3a + 3 - 1 = 0$$

$$-2a + 2 = 0$$

$$a = 1$$

The value of  $a$  is 1.

**QUESTION 9**

If  $-2$  is a zero of the polynomial  $3x^2 + 4x + 2k$  then find the value of  $k$ .

**SOLUTION:**

Given:  $-2$  is one of zeroes of the polynomial  $3x^2 + 4x + 2k$ , which means  $x = -2$  will satisfy it.

$$3(-2)^2 + 4(-2) + 2k = 0$$

$$12 - 8 + 2k = 0$$

$$4 + 2k = 0$$

$$k = -2$$

The value of  $k$  is  $-2$ .

**QUESTION 10**

Write the zeros of the polynomial  $x^2 - x - 6$ .

**SOLUTION:**

$$\text{Let } f(x) = x^2 - x - 6$$

$$= x^2 - 3x + 2x - 6$$

$$= x(x - 3) + 2(x - 3)$$

$$= (x - 3)(x + 2)$$

To find the zeros of  $f(x)$ , let  $f(x) = 0$ , we get

$$(x - 3)(x + 2) = 0$$

$$\text{Either } x - 3 = 0 \text{ or } x + 2 = 0$$

$$x = 3 \text{ or } x = -2$$

Therefore, 3,  $-2$  are zeros.

**QUESTION 11**

If the sum of the zeros of the quadratic polynomial  $kx^2 - 3x + 5$  is 1, write the value of  $k$ .

**SOLUTION:**

Given: Sum of zeros of polynomial is  $kx^2 - 3x + 5$  is 1.

We know that,

Sum of zeros =  $-(\text{coefficient of } x)/(\text{coefficient of } x^2) = -(-3)/k = 3/k$

From above results, we get

$$3/k = 1$$

$$\text{Or } k = 3$$

**QUESTION 12**

If the product of the zeros of the quadratic polynomial  $x^2 - 4x + k$  is 3 then write the value of  $k$ .

**SOLUTION:**

Given: Product of zeros of polynomial is  $x^2 - 4x + k$  is 3.

We know that,

Product of zeros =  $(\text{constant term})/(\text{coefficient of } x^2) = k/1 = k$

From above results, we get

$$k = 3$$

**QUESTION 13**

If  $(x + a)$  is a factor of  $(2x^2 + 2ax + 5x + 10)$ , find the value of  $a$ .

**SOLUTION:**

Given:  $(x + a)$  is a factor of  $2x^2 + (2a + 5)x + 10$ .

Which shows that one of the zeros of the given polynomial is  $x + a = 0$ , i.e.  $-a$ .

Now,  $x = -a$  satisfy the given polynomial.

$$2(-a)^2 + (2a + 5)(-a) + 10 = 0$$

$$2a^2 - 2a^2 - 5a + 10 = 0$$

$$5a = 10$$

$$a = 2$$

**QUESTION 14**

If  $(a - b)$ ,  $a$  and  $(a + b)$  are zeros of the polynomial  $2x^3 - 6x^2 + 5x - 7$ , write the value of  $a$ .

**SOLUTION:**

$(a - b)$ ,  $a$ ,  $(a + b)$  are the zeros of  $2x^3 - 6x^2 + 5x - 7$

Sum of zeros =  $-(\text{coefficient of } x)/(\text{coefficient of } x^2)$

$$a - b + a + a + b = -(-6) / 2 = 3$$

$$3a = 3$$

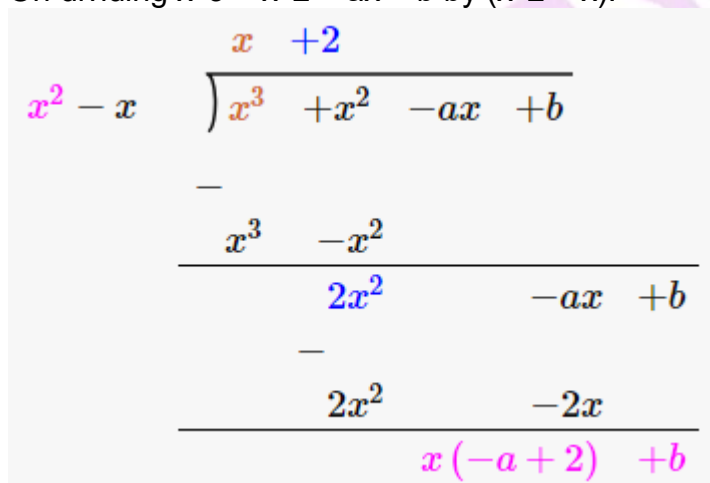

or  $a = 1$

**QUESTION 15**

If  $x^3 + x^2 - ax + b$  is divisible by  $(x^2 - x)$ , write the values of  $a$  and  $b$ .

**SOLUTION:**

On dividing  $x^3 + x^2 - ax + b$  by  $(x^2 - x)$ :

$$\begin{array}{r}
 x^2 - x \quad \overline{) \quad x^3 + x^2 - ax + b} \\
 \underline{x^3 - x^2} \phantom{- ax + b} \\
 2x^2 - ax + b \\
 \underline{2x^2 - 2x} \\
 x(-a + 2) + b
 \end{array}$$

Remainder =  $(2 - a)x + b$

Since given polynomial is divisible by  $x^2 - x$  (given)  
So remainder should be zero.

Therefore,

$$(2 - a)x + b = 0$$

only possible if,  $2 - a = 0$  and  $b = 0$

$$a = 2 \text{ and } b = 0$$

Hence, the values are :  $a = 2$ ,  $b = 0$

**QUESTION 16**

If  $\alpha$  and  $\beta$  are the zeros of the polynomial  $2x^2 + 7x + 5$ , write the value of  $\alpha + \beta + \alpha\beta$ .

**SOLUTION:**

Given:  $\alpha$  and  $\beta$  are the zeros of polynomial  $2x^2 + 7x + 5$

$$\alpha + \beta = \text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = -7/2$$

$$\alpha\beta = \text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = 5/2$$

$$\alpha + \beta + \alpha\beta = (\alpha + \beta) + \alpha\beta = -7/2 + 5/2 = -1$$

**QUESTION 17**

**State division algorithm for polynomials.**

**SOLUTION:**

Division algorithm for polynomials states that:  $f(x) = q(x)g(x) + r(x)$

Where  $f(x)$  and  $g(x)$  are any two polynomials with  $g(x) \neq 0$ .

After dividing  $f(x)$  by  $g(x)$ , we get two other polynomials,  $q(x)$  and  $r(x)$

where  $r(x) = 0$  and degree of  $r(x) <$  degree of  $g(x)$

**QUESTION 18**

**The sum of the zeros and the product of zeros of a quadratic polynomial are  $-1/2$  and  $-3$  respectively. Write the polynomial.**

**SOLUTION:**

$$\text{Sum of zeros} = -1/2$$

$$\text{Product of zeros} = -3$$

We know that, general form of a Polynomial:

$$x^2 - (\text{Sum of zeros})x + \text{product of zeros}$$

$$\text{This implies: } x^2 - (-1/2)x + (-3)$$

$$x^2 + 1/2x - 3$$

**QUESTION 19**

Write the zeros of the quadratic polynomial  $f(x) = 6x^2 - 3$ .

**SOLUTION:**

To find the zeros of the quadratic polynomial, put  $f(x) = 0$

$$6x^2 - 3 = 0$$

$$3(2x^2 - 1) = 0$$

$$2x^2 = 1$$

$$x^2 = 1/2$$

$$\text{or } x = \pm 1/\sqrt{2}$$

Zeros of the given polynomial are  $1/\sqrt{2}$  and  $-1/\sqrt{2}$ .

**QUESTION 20**

Write the zeros of the quadratic polynomial  $f(x) = 4\sqrt{3}x^2 + 5x - 2\sqrt{3}$ .

**SOLUTION:**

$$f(x) = 4\sqrt{3}x^2 + 5x - 2\sqrt{3}$$

To find the zeros of the quadratic polynomial, put  $f(x) = 0$

$$4\sqrt{3}x^2 + 5x - 2\sqrt{3} = 0$$

$$4\sqrt{3}x^2 + 8x - 3x - 2\sqrt{3} = 0$$

$$4x(\sqrt{3}x + 2) - \sqrt{3}(\sqrt{3}x + 2) = 0$$

$$(4x - \sqrt{3})(\sqrt{3}x + 2) = 0$$

Either  $(\sqrt{3}x + 2) = 0$  or  $(4x - \sqrt{3}) = 0$

$$x = -2/\sqrt{3} \text{ or } x = \sqrt{3}/4$$

**QUESTION 21**

If  $\alpha$  and  $\beta$  are the zeros of the polynomial  $f(x) = x^2 - 5x + k$  such that  $\alpha - \beta = 1$ , find the value of  $k$ .

**SOLUTION:**

Given:  $\alpha$  and  $\beta$  are zeroes of  $f(x) = x^2 - 5x + k$   
and  $\alpha - \beta = 1$

We know that,

$$\alpha + \beta = \text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = 5$$

$$\alpha \beta = \text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = k$$

Now solving  $\alpha - \beta = 1$  and  $\alpha + \beta = 5$ , we get:

$$\alpha = 3 \text{ and } \beta = 2$$

Again:  $\alpha \beta = k$  (putting value of  $\alpha$  and  $\beta$ )

$$k = 6.$$

**QUESTION 22**

If  $\alpha$  and  $\beta$  are the zeros of the polynomial  $f(x) = 6x^2 + x - 2$ , find the value of  $(\alpha/\beta + \beta/\alpha)$

**SOLUTION:**

Given:  $\alpha$  and  $\beta$  are zeroes of  $f(x) = 6x^2 + x - 2$

To find:  $(\alpha/\beta + \beta/\alpha)$

$$\alpha + \beta = \text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = -1/6$$

$$\alpha \beta = \text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = -1/3$$

Now,

$$(\alpha/\beta + \beta/\alpha) = \{(\alpha + \beta)^2 - 2\alpha\beta\} / \alpha\beta$$

$$= (1/36 + 2/3) / (-1/3)$$

$$= -25/12$$

**QUESTION 23**

If  $\alpha$  and  $\beta$  are the zeros of the polynomial  $f(x) = 5x^2 - 7x + 1$ , find the value of  $(1/\alpha + 1/\beta)$

**SOLUTION:**

Given:  $\alpha$  and  $\beta$  are zeroes of  $f(x) = 5x^2 - 7x + 1$

To find:  $(1/\alpha + 1/\beta)$

$$\alpha + \beta = \text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = 7/5$$

$$\alpha\beta = \text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = 1/5$$

Now,

$$(1/\alpha + 1/\beta) = (\alpha + \beta) / \alpha\beta$$

$$= 7/5 \times 5/1$$

$$= 7$$

**QUESTION 24**

If  $\alpha$  and  $\beta$  are the zeros of the polynomial  $f(x) = x^2 + x - 2$ , find the value of  $(1/\alpha - 1/\beta)$

**SOLUTION:**

Given:  $\alpha$  and  $\beta$  are zeroes of  $f(x) = x^2 + x - 2$

To find:  $(1/\alpha - 1/\beta)$

$$\alpha + \beta = \text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = -1$$

$$\alpha\beta = \text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = -2$$

Now,

$$(1/\alpha - 1/\beta) = (\beta - \alpha)^2 / \alpha\beta$$

$$= (\beta + \alpha)^2 - 4\alpha\beta / (\alpha\beta)^2$$

$$= 9/4$$

**QUESTION 25**

If the zeros of the polynomial  $f(x) = x^3 - 3x^2 + x + 1$  are  $(a - b)$ ,  $a$  and  $(a + b)$ , find  $a$  and  $b$ .

**SOLUTION:**

Given: Zeros of the polynomial  $x^3 - 3x^2 + x + 1$  are  $(a - b)$ ,  $a$  and  $(a + b)$ .

Now by using the relationship between the zeros of the quadratic polynomial we have:

$$\text{Sum of zeros} = -(\text{coefficient of } x)/(\text{coefficient of } x^2) = -1$$

$$a - b + a + a + b = -1$$

$$3a = 3$$

$$a = 1$$

$$\text{Product of zeros} = (\text{constant term})/(\text{coefficient of } x^2) = -1$$

$$(a - b)(a)(a + b) = -1$$

$$(1 - b)(1)(1 + b) = -1$$

$$1 - b^2 = -1$$

$$b = \pm\sqrt{2}$$
