ARTIFICIAL INTELLIGENCE

Artificial intelligence is an emerging technology that facilitates intelligence and human capabilities of sense, comprehend and act with the use of machines. Some of the technologies can allow these systems in analyzing and understanding all the information that is received are the natural language processing and inference engines. Artificial Intelligence is a system that provides action through technologies such as expert systems and inference engines to undertake operations in the physical world.

Global Developments in Artificial Intelligence

- The economic and social benefits of applied AI are familiar in all the countries of the world.
- In the area of core research in AI and related technologies, universities and research institutions from the US, China and Japan have led the publication volume on AI research topics between 2010 and 2016.
- Potential of AI Governance structures for enabling all the above mandates vary across countries. Many countries have instituted dedicated public offices such as Ministry of AI (UAE), and Office of AI and AI Council (U.K.) while China and Japan have allowed existing ministries to take up AI implementation in their sectoral areas.

Artificial Intelligence has the potential to provide sizeable incremental value to a wide range of sectors globally and is expected to be the key source of competitive advantage for firms.

- Healthcare: AI plays an important role in the field of healthcare by addressing issues of high barriers particularly in rural areas that lacks poor communication and professional healthcare system. Some of the emerging application includes: AI driven diagnostics, personalised treatment, early identification of potential pandemics, and imaging diagnostics.

- Agriculture: AI has a major role to play in driving a food revolution and meeting the increased demand for food. Applied AI address challenges such as lack of assured irrigation, inadequate demand prediction, excess use of the pesticides, fertilisers and fungicides. Some uses include improved crop production through advanced detection of pest attacks, prediction of crop prices and real time advisory.
- **Transports, Logistics and Smart Mobility**: This domain mainly includes various autonomous and semi-autonomous features, for example, monitoring and maintaining predictive engine along with driver assist. Other applications of AI includes improved traffic management, autonomous trucking and delivery.

- **Retail**: Being one of the early adopters of AI solutions, it provides applications such as developing user experience by personalized suggestions, image-based product search and preference-based browsing. Other uses includes customer demand anticipation, improved inventory management, and efficient delivery management.

- **Manufacturing**: It can enable 'Factory of the Future' through flexible and adaptable technical systems to facilitate various processes and machinery to respond to unfamiliar or unexpected situations by making smart decisions. Impact areas include engineering, supply chain management, production, maintenance, quality assurance, and in-plant logistics and warehousing.

- **Energy**: Potential use of Artificial Intelligence also includes modelling and forecasting of the energy system to reduce unpredictability. AI also focuses in increasing the efficiency of power balancing and enabling storage of energy in renewable energy systems. This process uses smart meters to enable intelligent grids, thus, improving affordability and reliability of the solar energy. Apart from these, AI may also be deployed for predictive maintenance of grid infrastructure.

- **Smart Cities**: Incorporation of applied AI in developing cities could also help in meeting the demands of a rapidly growing population and providing them with enhanced quality of life. Traffic control for reducing congestion, enhanced security by providing improved crowd management are some of the potential uses of AI system.

- **Education and Skilling**: AI plays a major role in the Indian education sector by providing solution for quality and access issues including augmentation and enhancement of the learning experience through personalized learning, automating and expediting administrative tasks, and predicting the need for student intervention to reduce dropouts or recommend vocational training.

**CHALLENGES WITH AI IN INDIA**

- Absence of collaborative effort between various stakeholders
- Concerns on privacy and security of data, including lack of formal regulation around
anonymisation of data.

- Lack of sufficient talent to build and deploy AI systems at scale. An estimate claims that only 4% of AI professionals in India have worked on emerging technologies such as deep learning and neural networks. There is also a significant gap of PhD research scholars in the field.
- Difficulty in access to industry specific data required to build customised platforms and solutions is now currently in the hands of a few major players. It is challenging for new beginners to provide customised services that can compete with the existing data that includes rich incumbents such as Facebook or Google. This phenomenon results in the creation of a virtuous cycle which reinforces the hegemony of the big few, creating a huge entry barrier for start-ups.
- High cost and low availability of computing infrastructure required for development, training and deployment of AI based services. Cloud infrastructure, though growing rapidly, has limited capability.
- Lack of infrastructure is the major reason for many Indian AI start-ups that aims to incorporate their business outside the country, thus, making AI outside the reach of Indian researchers in government labs and many industries. Initiatives like Gi Cloud (MeghRaj), are in the right direction.
- Lack of AI awareness in resolving business-related issues in most of the public enterprises and government agencies, has led to the scarcity of AI professionals in obstructing adoption.

WAY FORWARD TO HARNESS THE POWER OF AI

- **Instigating Core and Applied Research in AI:** Advanced research, both core and applied, provides the basis for commercialization and utilization of any emerging technology, more so for technologies like AI. A considerable amount of dedication and efforts is required to build comprehensive research focusing on AI strategy for India.
- **Getting India ready for the AI wave:** India may appear to be relatively well-positioned to take advantage of the disruption in AI system through its advanced IT sector and large youth demographic potential to establish itself as the future hub for AI-related activities. However, given the reduced availability of qualified faculty and researchers, this advantage could quickly change into a liability without urgent government interventions towards promoting access to such skills. This is a critical component of AI development and should be a national priority.
Accelerating Adoption: Adoption of AI in India has been slow and remains limited. Estimates indicate that only 22% of the firms in India use AI in any business process. Government intervention is needed to promote AI adoption, lest India loses the chance to secure a prominent position on the global AI map. While acknowledging the need to improve AI, governments at different levels, along with their various instrumentalities, should adopt proactive measures to accelerate AI adoption in multiple processes.

Ethics, Privacy, Security and Artificial Intelligence: AI is going to be the tipping point in the technological evolution of mankind, with human dependence on machines and algorithms for decision making never been such profound. Thus, any strategy document on promoting AI necessarily needs to be conscious of the probable factors of the AI ecosystem that may undermine ethical conduct, impinge on one’s privacy and undermine the security protocol. Appropriate steps to mitigate these risks need to be an integral part of any such strategy. For e.g., National Cyber Security Policy (NCSP – 2013) talks about Sensitization of citizens, consumers and employees on cyber security threats and basic and best practices Sensitization towards the safety of cyber threats and in pursuance of security programs.

These challenges, if addressed by relevant stakeholders, with the government playing a leading role could lead to fundamental building blocks that form the core to India’s march towards leadership in AI in an expeditious manner through concerted and collaborative efforts.
