Let AB be the tower and BC be the length of the shadow of the tower.

Here, $\theta$ is the angle of elevation of the sun.

Given, length of shadow of tower $= \sqrt{3} \times \text{Height of the tower.}$

$BC = \sqrt{3} \ AB \ldots \ (1)$

In right $\triangle ABC,$

$\tan \theta = \frac{AB}{BC} \left[ \tan \theta = \frac{\text{Opposite side}}{\text{Adjacent side}} \right]$
\[
\tan \theta = \frac{AB}{\sqrt{3}AB} \quad \text{[Using (1)]}
\]
\[
\Rightarrow \tan \theta = \frac{1}{\sqrt{3}}
\]
\[
\Rightarrow \tan \theta = \tan 30^0 \quad \text{[\because \tan 30^0 = \frac{1}{\sqrt{3}}]}
\]
\[
\Rightarrow \theta = 30^0
\]
Thus, the angle of elevation of the sun is 30^0.

Hence, the correct answer is B.

Q2
Let \( r_1 \) and \( r_2 \) be the radii of the two given circles.

Given, \( 2r_1 = 10 \text{ cm} \)
\[
\therefore r_1 = 5 \text{ cm}
\]

Also, \( 2r_2 = 24 \text{ cm} \)
\[
\therefore r_2 = 12 \text{ cm}
\]

Let \( R \) be the radius of the larger circle.

Given, area of larger circle = Sum of areas of two given circles
\[
\therefore \pi R^2 = \pi r_1^2 + \pi r_2^2
\]
\[
\Rightarrow R^2 = (5 \text{ cm})^2 + (12 \text{ cm})^2
\]
\[
\Rightarrow R^2 = 25 \text{ cm}^2 + 144 \text{ cm}^2
\]
\[
\Rightarrow R^2 = 169 \text{ cm}^2
\]
\[
\Rightarrow R = \sqrt{169} \text{ cm}
\]
\[
\Rightarrow R = 13 \text{ cm}
\]
Thus, the diameter of the larger circle is (2 x 13) cm = 26 cm

Hence, the correct answer is B.

Q3
Let the radius and height of the original cylinder be \( r \) and \( h \) respectively.
∴ Volume of the original cylinder = \( \pi r^2 h \)

According to the question, radius of the new cylinder is halved keeping the height same.

\[ \Rightarrow \text{Radius of the new cylinder} = \frac{r}{2} \]

Also, height of the new cylinder = \( h \)

∴ Volume of the new cylinder = \( \pi \left( \frac{r}{2} \right)^2 h = \frac{\pi r^2 h}{4} \)

∴ \[ \frac{\text{Volume of the new cylinder}}{\text{Volume of the original cylinder}} = \frac{(\pi r^2 h/4)/(\pi r^2 h)}{(1/4)} = 1 : 4 \]

Hence, the correct answer is C.

Q4

Elementary events associated with random experiment of the given two dice are:

\[
(1, 1) \ (1, 2) \ (1, 3) \ (1, 4) \ (1, 5) \ (1, 6) \\
(2, 1) \ (2, 2) \ (2, 3) \ (2, 4) \ (2, 5) \ (2, 6) \\
(3, 1) \ (3, 2) \ (3, 3) \ (3, 4) \ (3, 5) \ (3, 6) \\
(4, 1) \ (4, 2) \ (4, 3) \ (4, 4) \ (4, 5) \ (4, 6) \\
(5, 1) \ (5, 2) \ (5, 3) \ (5, 4) \ (5, 5) \ (5, 6) \\
(6, 1) \ (6, 2) \ (6, 3) \ (6, 4) \ (6, 5) \ (6, 6) \\
\]

∴ Total number of outcomes = 36

Let A be the event of getting same number on both dice.

Elementary events favourable to event A are (1,1), (2,2), (3,3), (4,4), (5,5) and (6,6).

\[ \Rightarrow \text{Favourable number of outcomes} = 6 \]

\[ \Rightarrow P(A) = \frac{6}{36} = \frac{1}{6} \]

So, required probability is \( \frac{1}{6} \)
Hence, the correct answer is C.

Q5

Let P(x, y) divides line segment joining A(1, 3) and B(4, 6) in the ratio 2 : 1.

We know that, the coordinates of a point (x, y) dividing the line segment joining the points $(x_1, y_1)$ and $(x_2, y_2)$ in the ratio $m_1 : m_2$ are given by

\[
x = \frac{m_1 x_2 + m_2 x_1}{m_1 + m_2} \quad \text{and} \quad y = \frac{m_1 y_2 + m_2 y_1}{m_1 + m_2}
\]

\[
\therefore \text{Here } x = \frac{2(4) + 1(1)}{2 + 1} \quad \text{and} \quad y = \frac{2(6) + 1(3)}{2 + 1}
\]

\[
\Rightarrow x = \frac{9}{3} \quad \text{and} \quad y = \frac{15}{3}
\]

\[
\Rightarrow x = 3 \quad \text{and} \quad y = 5
\]

Thus, (3, 5) divides the line segment AB in the ratio 2:1.

Hence, the correct answer is B.

Q6

Let AB be the diameter and O be the centre of the circle.

We are given co-ordinates of one end point of circle and co-ordinates of its centre.

So, co-ordinates of A are (2, 3) and centre O are (-2, 5).

Let co-ordinates of point B be (x, y).

We know that centre of a circle is the midpoint of the diameter.

\[
\therefore \text{By midpoint formula,}
\]

\[
-2 = \frac{2 + x}{2} \quad \text{and} \quad 5 = \frac{3 + y}{2}
\]

\[
\Rightarrow -4 = 2 + x \quad \text{and} \quad 10 = 3 + y
\]

\[
\Rightarrow x = -6 \quad \text{and} \quad y = 7
\]

So, other end of the diameter is (-6, 7).

Hence, the correct answer is A.

Q7
Odd natural numbers are in the pattern 1,3,5,7,9.....

These numbers form an A.P. where $a = 1$, $d = 3 – 1 = 2$

We know that, $S_n = \frac{n}{2} [2a + (n – 1)d]$

$\therefore S_{20} = \frac{20}{2} [2 \times 1 + (20 – 1) \times 2]$

$= \frac{20}{2} [2 + 19 \times 2]$

$= 10[2 + 38]$

$= 10 \times 40$

$= 400$

Thus, the sum of first 20 odd natural numbers is 400.

Hence, the correct answer is C.

Q8

The given equations are $ay^2 + ay + 3 = 0$ and $y^2 + y + b = 0$

Given, 1 is the root of both the equations

Therefore, $y = 1$ will satisfy both these equations.

Putting $y = 1$ in $ay^2 + ay + 3 = 0$, we get

$a(1)^2 + a \times 1 + 3 = 0$

$\therefore a + a + 3 = 0$

$\Rightarrow 2a + 3 = 0$

$\Rightarrow 2a = -3$

$\Rightarrow a = -\frac{3}{2} \quad \ldots \ldots (1)$

Putting $y = 1$ in $y^2 + y + b = 0$, we get

$(1)^2 + 1 + b = 0$
\[
\cdot 1 + 1 + b = 0 \\
\Rightarrow 2 + b = 0 \\
\Rightarrow b = -2 \quad \text{.....(2)}
\]
\[
\therefore ab = \frac{3}{2} \cdot (-2) = 3 \quad \text{[Using (1) & (2)]}
\]
Thus, the value of ab is 3.

Hence, the correct answer is A.

Q9
Given, AP = 4 cm, BP = 3 cm and AC = 11 cm.

The lengths of tangents drawn from an external point to the circle are equal.

AP = AR, BP = BQ, CQ = CR \text{ ....... (1)}

AC = 11 cm
\[
\Rightarrow AR + RC = 11 \text{ cm} \\
\Rightarrow AP + CQ = 11 \text{ cm} \quad \text{[From equation (1)]} \\
\Rightarrow 4 \text{ cm} + CQ = 11 \text{ cm} \\
\Rightarrow CQ = (11 - 4) \text{ cm} \\
\Rightarrow CQ = 7 \text{ cm}
\]

BP = BQ = 3 cm

Now, BC = BQ + QC
\[
\Rightarrow BC = (3 + 7) \text{ cm} \\
\Rightarrow BC = 10 \text{ cm}
\]
Hence, the correct option is B.

Q10
EK = 9 cm

As length of tangents drawn from an external point to the circle are equal.
\[ \therefore \text{EK} = \text{EM} = 9 \text{ cm} \]

Also, \(\text{DH} = \text{DK}\) and \(\text{FH} = \text{FM}\) .....(1)

\[ \text{EK} = \text{EM} = 9 \text{ cm} \]

\[ \Rightarrow \text{ED} + \text{DK} = 9 \text{ cm} \text{ and } \text{EF} + \text{FM} = 9 \text{ cm} \]

\[ \Rightarrow \text{ED} + \text{DH} = 9 \text{ cm} \text{ and } \text{EF} + \text{FM} = 9 \text{ cm} \text{ [From equation (i)]} \text{ ...(ii)} \]

Perimeter of \(\triangle \text{EDF}\) = \(\text{ED} + \text{DF} + \text{EF}\)

= \(\text{ED} + \text{DH} + \text{HF} + \text{EF}\)

= \((9 + 9) \text{ cm}\) \[\text{[From equation (ii)]}\]

= 18 cm

Hence, the correct option is A.

Q11

The given points are \(A (0, 2), B (3, p)\) and \(C (p, 5)\).

According to the question, \(A\) is equidistant from point \(B\) and \(C\).

\[ \therefore \text{AB} = \text{AC} \]

\[ \Rightarrow \sqrt{(3 - 0)^2 + (p - 2)^2} = \sqrt{(p - 0)^2 + (5 - 2)^2} \]

\[ \Rightarrow \sqrt{9 + (p - 2)^2} = \sqrt{p^2 + 9} \]

\[ \Rightarrow p^2 - 4p + 13 = p^2 + 9 \]

\[ \Rightarrow -4p = -4 \]

\[ \Rightarrow p = 1 \]

Q12

Total number of outcomes = 50
Multiples of 3 and 4 which are less than or equal to 50 are:

12, 24, 36, 48

Favourable number of outcomes = 4

Probability of the number being a multiple of 3 and 4

\[
\frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{4}{50} = \frac{2}{25}
\]

Q13

Given, volume of hemisphere = \(2425 \frac{1}{2}\) cm\(^3\) = \(\frac{4851}{2}\) cm\(^3\)

Let the radius of the hemisphere be ‘r’ cm.

Volume of hemisphere = \(\frac{2}{3} \pi r^3\)

\[
\Rightarrow \frac{2}{3} \pi r^3 = \frac{4851}{2}
\]

\[
\Rightarrow \frac{2}{3} \times \frac{22}{7} \times r^3 = \frac{4851}{2}
\]

\[
\Rightarrow r^3 = \frac{4851 \times 3 \times 7}{2 \times 2 \times 22}
\]

\[
\Rightarrow r^3 = \frac{441 \times 21}{2 \times 2 \times 2}
\]

\[
\Rightarrow r^3 = \frac{21 \times 21 \times 21}{2 \times 2 \times 2}
\]

\[
\Rightarrow r = \sqrt[3]{\frac{21 \times 21 \times 21}{2 \times 2 \times 2}}
\]

\[
\Rightarrow r = \frac{21}{2} \text{ cm} \quad \text{.....(1)}
\]

∴ Curved surface area of hemisphere = \(2 \pi r^2\)

\[
= 2 \times \frac{22}{7} \times \left(\frac{21}{2}\right)^2 \quad \text{[ Using (1)]}
\]

\[
= 2 \times \frac{22}{7} \times \frac{21 \times 21}{2 \times 2}
\]
Given that: \( OA = 8 \text{ cm},\ OB = 5 \text{ cm} \) and \( AP = 15 \text{ cm} \)

To find: \( BP \)

Construction: Join \( OP \).

Now, \( OA \perp AP \) and \( OB \perp BP \). \( \therefore \) Tangent to a circle is perpendicular to the Radius through the point of contact

\[ \Rightarrow \angle OAP = \angle OB P = 90^\circ \]

On applying Pythagoras theorem in \( \triangle OAP \), we obtain:

\[ (OP)^2 = (OA)^2 + (AP)^2 \]

\[ \Rightarrow (OP)^2 = (8)^2 + (15)^2 \]

\[ \Rightarrow (OP)^2 = 64 + 225 \]

\[ \Rightarrow OP = \sqrt{289} \]

\[ \Rightarrow (OP)^2 = 289 \]

\[ \Rightarrow OP = 17 \text{ cm} \]

Thus, the length of \( OP \) is 17 cm.

On applying Pythagoras theorem in \( \triangle OBP \), we obtain:

\[ (OP)^2 = (OB)^2 + (BP)^2 \]

\[ \Rightarrow (17)^2 = (5)^2 + (BP)^2 \]

\[ \Rightarrow 289 = 25 + (BP)^2 \]
(BP)^2 = 289 - 25
⇒ (BP)^2 = 264
⇒ BP = 16.25 cm (approx.)
Hence, the length of BP is 16.25 cm.

Q15
Given: An isosceles \( \triangle ABC \) with \( AB = AC \), circumscribing a circle.

To prove: \( P \) bisects \( BC \)

Proof:
\( AR \) and \( AQ \) are the tangents drawn from an external point \( A \) to the circle.
∴ \( AR = AQ \) (Tangents drawn from an external point to the circle are equal)

Similarly, \( BR = BP \) and \( CP = CQ \).

It is given that in \( \triangle ABC \), \( AB = AC \).
⇒ \( AR + RB = AQ + QC \).
⇒ \( BR = QC \) (As \( AR = AQ \))
⇒ \( BP = CP \) (As \( BR = BP \) and \( CP = CQ \))
⇒ \( P \) bisects \( BC \).
Hence, the result is proved.

OR

Given: Two concentric circles \( C_1 \) and \( C_2 \) with centre \( O \), and \( AB \) is the chord of \( C_1 \) touching \( C_2 \) at \( C \).

To prove: \( AC = CB \)
Construction: Join OC.

Proof: AB is the chord of \( C_1 \) touching \( C_2 \) at \( C \), then AB is the tangent to \( C_2 \) at \( C \) with OC as its radius.

We know that the tangent at any point of a circle is perpendicular to the radius through the point of contact.

\[ \therefore OC \perp AB \]

Considering, AB as the chord of the circle \( C_1 \). So, \( OC \perp AB \).

\[ \therefore OC \] is the bisector of the chord AB.

Hence, \( AC = CB \) (Perpendicular from the centre to the chord bisects the chord).

Q16

It is given that OABC is a square of side 7 cm.

\[ \therefore \text{Area of square OABC} = (7)^2 \text{ cm}^2 = 49 \text{ cm}^2 \]

Also, it is given that OAPC is a quadrant of circle with centre O.

\[ \therefore \text{Radius of the quadrant of the circle} = OA = 7 \text{ cm} \]

\[ \therefore \text{Area of the quadrant of circle} = \frac{1}{4} (\pi r^2) \]

\[ = \frac{1}{4} (\pi * 7^2) \text{ cm}^2 \]

\[ = \frac{49\pi}{4} \text{ cm}^2 \]

\[ = \frac{49}{4} \times \frac{22}{7} \text{ cm}^2 \]

\[ = \frac{77}{2} \text{ cm}^2 \]

\[ \therefore \text{Area of the shaded region} = \text{Area of Square} - \text{Area of Quadrant of circle.} \]

\[ = [49 - \frac{77}{2}] \text{ cm}^2 \]

\[ = [\frac{98-77}{2}] \text{ cm}^2 \]

\[ = \frac{21}{2} \text{ cm}^2 \]

\[ = 10.5 \text{ cm}^2 \]
Thus, the area of the shaded region is 10.5 cm².

Q17

Three digit natural numbers which are multiples of 7 are 105, 112, 119,.....,994.

105, 112, 119,.........994 are in A.P.

First term (a) = 105

Common difference (d) = 7

Let 994 be the nth term of A.P.

\[
\begin{align*}
\therefore a_n &= 994 \\
\Rightarrow 105 + (n-1) \times 7 &= 994 \quad [\therefore a_n = a + (n-1)d] \\
\Rightarrow 7(n-1) &= 994 - 105 \\
\Rightarrow 7(n-1) &= 889 \\
\Rightarrow n-1 &= 127 \\
\Rightarrow n &= 128 \\
\end{align*}
\]

Sum of all the terms of A.P. = \( \frac{128}{2} \times (105 + 994) \) [\because S_n = \frac{n}{2} (a + l), l being last term]

= 64 \times 1099

= 70336

Thus, the sum of all three digit natural numbers which are multiples of 7 is 70336.

Q18

The given quadratic equation is \( 3x^2 – 2kx + 12 = 0 \)

On comparing it with the general quadratic equation \( ax^2 + bx + c = 0 \), we obtain

\( a = 3, \ b = -2k \) and \( c = 12 \)

discriminant, ‘D’ of the given quadratic equation is given by

\( D = b^2 – 4ac \)
\[ (-2k)^2 - 4 \times 3 \times 12 = 4k^2 - 144 \]

For equal roots of the given quadratic equations, Discriminant will be equal to 0.

i.e., \( D = 0 \)

\[ \Rightarrow 4k^2 - 144 = 0 \]

\[ \Rightarrow 4(k^2 - 36) = 0 \]

\[ \Rightarrow k^2 = 36 \]

\[ \Rightarrow k = \pm 6 \]

Thus, the values of \( k \) for which the quadratic equation \( 3x^2 - 2kx + 12 = 0 \) will have equal roots are 6 and \(-6\).

Q19

The given points are \( A(3, -5) \) and \( B(-4, 8) \).

Here, \( x_1 = 3, y_1 = -5, x_2 = -4 \) and \( y_2 = 8 \).

Since \( \frac{AP}{PB} = \frac{K}{1} \), the point \( P \) divides the line segment joining the points \( A \) and \( B \) in the ratio \( K : 1 \). The coordinates of \( P \) can be found using the section formula \( \frac{mx_2 + nx_1}{m+n}, \frac{my_2 + ny_1}{m+n} \)

Here, \( m = K \) and \( n = 1 \)

Co-ordinates of \( P \) = \( \left( \frac{K \times (-4) + 1 \times 3}{K+1}, \frac{K \times 8 + 1 \times (-5)}{K+1} \right) = \left( \frac{-4K+3}{K+1}, \frac{8K-5}{K+1} \right) \)

It is given that, \( P \) lies on the line \( x+y = 0 \).

\[ \therefore \frac{-4K+3}{K+1} + \frac{8K-5}{K+1} = 0 \]

\[ \Rightarrow \frac{-4K+3+8K-5}{K+1} = 0 \]

\[ \Rightarrow 4K - 2 = 0 \]

\[ \Rightarrow 4K = 2 \]

\[ \Rightarrow K = \frac{1}{2} \]

Thus, the required value of \( K \) is \( \frac{1}{2} \).
Q20

Given, vertices of a triangle are (1,-3), (4, p) and (-9, 7).

\[ x_1 = 1, \quad y_1 = -3 \]
\[ x_2 = 4, \quad y_2 = p \]
\[ x_3 = -9, \quad y_3 = 7 \]

Area of given triangle

\[ \text{Area} = \frac{1}{2} \left[ x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2) \right] \]
\[ = \frac{1}{2} \left[ 1(p-7) + 4(7+3) + (-9)(-3-p) \right] \]
\[ = \frac{1}{2} \left[ 10p + 60 \right] \]
\[ = 5(p+6) \]

Here, the obtained expression may be positive or negative.

\[ \therefore 5(p+6) = 15 \text{ or } 5(p+6) = -15 \]
\[ \Rightarrow p + 6 = 3 \text{ or } p + 6 = -3 \]
\[ \Rightarrow p = -3 \text{ or } p = -9 \]

Q21
Since ABCD is a parallelogram,

\[ AB = CD \ldots (1) \]

\[ BC = AD \ldots (2) \]

It can be observed that

\[ DR = DS \text{ (Tangents on the circle from point D)} \]
\[ CR = CQ \text{ (Tangents on the circle from point C)} \]
\[ BP = BQ \text{ (Tangents on the circle from point B)} \]
\[ AP = AS \text{ (Tangents on the circle from point A)} \]

Adding all these questions, we obtain

\[ DR + CR + BP + AP = DS + CQ + BQ + AS \]
\[ (DR + CR) + (BP + AP) = (DS + AS) + (CQ + BQ) \]
\[ CD + AB = AD + BC \]

On putting the values of equations (1) and (2) in this equation, we obtain

\[ 2AB = 2BC \]
\[ AB = BC \ldots (3) \]

Comparing equations (1), (2) and (3), we obtain

\[ AB = BC = CD = DA \]

Hence, ABCD is a rhombus.
Let ABCD be a quadrilateral circumscribing a circle centered at O such that it touches the circle at points P, Q, R, S. Let us join the vertices of the quadrilateral ABCD to the center of the circle.

Consider $\triangle OAP$ and $\triangle OAS$,

$AP = AS$ (Tangents from the same point)

$OP = OS$ (Radii of the same circle)

$OA = OA$ (Common side)

$\triangle OAP \cong \triangle OAS$ (SSS congruence criterion)

Therefore, $A \leftrightarrow A, P \leftrightarrow S, O \leftrightarrow O$

And thus, $\angle POA = \angle AOS$

$\angle 1 = \angle 8$

Similarly,

$\angle 2 = \angle 3$

$\angle 4 = \angle 5$

$\angle 6 = \angle 7$

$\angle 1 + \angle 2 + \angle 3 + \angle 4 + \angle 5 + \angle 6 + \angle 7 + \angle 8 = 360^\circ$

$(\angle 1 + \angle 8) + (\angle 2 + \angle 3) + (\angle 4 + \angle 5) + (\angle 6 + \angle 7) = 360^\circ$

$2(\angle 1 + \angle 2) + 2(\angle 5 + \angle 6) = 360^\circ$
\((\angle 1 + \angle 2) + (\angle 5 + \angle 6) = 180^0\)

\(\angle AOB + \angle COD = 180^0\)

Similarly, we can prove that \(\angle BOC + \angle DOA = 180^0\)

Hence, opposite sides of a quadrilateral circumscribing a circle subtend supplementary angles at the centre of the circle.

Q22

It is given that, height \((h)\) of cylindrical part = height \((h)\) of the conical part = 7 cm

Diameter of the cylindrical part = 12 cm

\(\therefore\) Radius \((r)\) of the cylindrical part = \(\frac{12}{2}\) cm = 6 cm

\(\therefore\) Radius of conical part = 6 cm

Slant height \((l)\) of conical part = \(\sqrt{r^2 + h^2}\) cm

\[= \sqrt{6^2 + 7^2}\] cm

\[= \sqrt{36 + 49}\] cm

\[= \sqrt{85}\] cm

\[= 9.22\] cm (approx.)

Total surface area of the remaining solid

= CSA of cylindrical part + CSA of conical part + Base area of the circular part
\[= 2 \pi rh + \pi rl + \pi r^2\]

\[= 2 \times \frac{22}{7} \times 6 \times 7 \text{ cm}^2 + \frac{22}{7} \times 6 \times 9.22 \text{ cm}^2 + \frac{22}{7} \times 6 \times 6 \text{ cm}^2\]

\[= 264 \text{ cm}^2 + 173.86 \text{ cm}^2 + 113.14 \text{ cm}^2\]

\[= 551 \text{ cm}^2\]

OR

Height \((h_1)\) of cylindrical bucket = 32 cm

Radius \((r_1)\) of circular end of bucket = 18 cm

Height \((h_2)\) of conical heap = 24 cm

Let the radius of the circular end of conical heap be \(r_2\).

The volume of sand in the cylindrical bucket will be equal to the volume of sand in the conical heap.

Volume of sand in the cylindrical bucket = Volume of sand in conical heap

\[\pi \times r_1^2 \times h_1 = \frac{1}{3} \pi \times r_2^2 \times h_2\]

\[\pi \times 18^2 \times 32 = \frac{1}{3} \pi \times r_2^2 \times 24\]

\[r_2^2 = \frac{3 \times 18^2 \times 32}{24} = 18^2 \times 4\]

\[r_2 = 18 \times 2 = 36 \text{ cm}\]

slant height = \[\sqrt{36^2 + 24^2} = 12^2 + (3^2 + 2^2) = 12 \sqrt{13} \text{ cm}\]
therefore, the radius and slant height of the conical heap are 36 cm and $12\sqrt{13}$ cm respectively.

Q23

PQ and AB are the arcs of two concentric circles of radii 7 cm and 3.5 cm respectively.

Let $r_1$ and $r_2$ be the radii of the outer and the inner circle respectively.

Suppose $\theta$ be the angle subtended by the arcs at the centre O.

Then $r_1 = 7$ cm, $r_2 = 3.5$ cm and $\theta = 30^\circ$

Area of the shaded region

\[ = \text{Area of sector OPQ} - \text{Area of sector OAB} \]

\[ = \frac{\theta}{360^\circ} \pi r_1^2 - \frac{\theta}{360^\circ} \pi r_2^2 \]

\[ = \frac{\theta}{360^\circ} \pi (r_1^2 - r_2^2) \]

\[ = \frac{30^\circ}{360^\circ} \times \frac{22}{7} \times [(7 \text{ cm})^2 - (3.5 \text{ cm})^2] \]

\[ = \frac{1}{12} \times \frac{22}{7} \times (49 - 12.25) \text{ cm}^2 \]

\[ = \frac{1}{12} \times \frac{22}{7} \times 36.75 \text{ cm}^2 \]

\[ = 9.625 \text{ cm}^2 \]

thus, the area of the shaded region is 9.625 cm$^2$.

Q24

The given quadratic equation is $4x^2 - 4ax + (a^2 - b^2) = 0$

\[ 4x^2 - 4ax + (a^2 - b^2) = 0 \]

\[ \therefore 4x^2 - 4ax + (a-b)(a+b) = 0 \]

\[ \Rightarrow 4x^2 + [-2a -2a + 2b - 2b]x + (a-b)(a+b) = 0 \]

\[ \Rightarrow 4x^2 + (2b-2a)x - (2a+2b)x + (a-b)(a+b) = 0 \]

\[ \Rightarrow 4x^2 + 2(b-a)x - 2(a+b)x + (a-b)(a+b) = 0 \]
\[ 2x \left[ 2x - (a-b) \right] - (a+b) \left[ 2x - (a-b) \right] = 0 \]

\[ 2x - (a - b) \quad \text{or} \quad 2x - (a + b) = 0 \]

\[ 2x = a - b \quad \text{or} \quad 2x = a + b \]

\[ x = \frac{a-b}{2} \quad \text{or} \quad x = \frac{a+b}{2} \]

Thus, the solution of the given quadratic equation is given by \( x = \frac{a-b}{2} \) or \( x = \frac{a+b}{2} \)

OR

The given quadratic equation is \( 3x^2 - 2\sqrt{6}x + 2 = 0 \)

Comparing with the quadratic equation \( ax^2 + bx + c = 0 \), we have

\( a = 3, \ b = -2\sqrt{6} \quad \text{and} \quad c = 2 \)

discriminant of the given quadratic equation

\[ D = b^2 - 4ac = (2\sqrt{6})^2 - 4 \times 3 \times 2 = 24 - 24 = 0 \]

\[ \therefore x = \frac{-(-2\sqrt{6}) \pm \sqrt{0}}{2 \times 3} \quad \therefore x = \frac{-b \pm \sqrt{D}}{2a} \]

\[ \therefore x = \frac{2\sqrt{6}}{6} \]

\[ \therefore x = \frac{\sqrt{6}}{3} \]

Thus, the solution of the given quadratic equation is \( x = \frac{\sqrt{6}}{3} \).

Q25
Let C be the position of kite above the ground such that it subtends an angle of 60° at point A on the ground.

Suppose the length of the string AC be l m.

Given, BC = 45 m and ∠BAC = 60°.

In ΔABC:

\[
\sin 60° = \frac{BC}{AC} \quad \therefore \quad \sin θ = \frac{\text{Perpendicular}}{\text{Hypotenuse}}
\]

Therefore, \( \frac{\sqrt{3}}{2} = \frac{45}{l} \)

\( \therefore \quad l = \frac{45 \times 2}{\sqrt{3}} = \frac{90}{\sqrt{3}} = 30\sqrt{3} \)

Thus, the length of the string is \(30\sqrt{3}\) m.

Q26

Given:

BC = 6 cm, ∠C = 30° and ∠A = 105°

Therefore ∠B = 180° – (∠A + ∠C) (In ΔABC, ∠A + ∠B + ∠C = 180°)

= 180° – (105° + 30°)

= 45°

Steps of construction:

1. draw a line BC = 6 cm.
2. draw a ray CN making an angle of 30° at C.
3. draw a ray BM making an angle of 45° at B.
4. locate the point of intersection of rays CN and BM and name it as A.
5. ABC is the triangle whose similar triangle is to be drawn.
6. Draw any ray BX making an acute angle with BC on the side opposite to the vertex A.
7. Locate 3 (Greater of 2 and 3 in 2/3 ) points B₁, B₂ and B₃ on BX so that BB₁ = B₁B₂ = B₂B₃.
8. Join B₃C and draw a line through B₂ (smaller of 2 and 3 in 2/3) parallel to B₃C to intersect BC at C'.
9. Draw a line through C' parallel to the line CA to intersect BA at A'.
10. A ‘BC’ is the required similar triangle whose sides are 2/3 times the corresponding sides of △ABC.

Q27

Let a be the first term and d be the common difference of the given A.P.

According to the given question,

16th term of the AP = 2 x 8th term of the AP + 1

i.e., a₁₆ = 2a₈ + 1

a + (16-1)d = 2[a+(8-1)d] +5  \(\text{because } aₙ = a+(n-1)d\)

\(\Rightarrow a+15d = 2[a+7d] +5\)
\(\Rightarrow a+15d = 2a+14d+5\)
\(\Rightarrow d = a+1 \quad \ldots '(1)\)

Also, 12th term, a₁₂ = 47

\(\Rightarrow a+(12-1)d = 47\)
\(\Rightarrow a+11d = 47\)
\(\Rightarrow a+11(a+1) = 47 \quad \left[\text{Using (1)}\right]\)
\(\Rightarrow a+11a+11 = 47\)
\(\Rightarrow 12a = 36\)
\(\Rightarrow a = 36\)

On putting the value of a in (1), we get d = 3+1 = 4

Thus, nᵗʰ term of the AP, aₙ = a + (n-1)d

On putting the respective values of a and d, we get

\(aₙ = 3+(n-1)4 = 3 + 4n- 4 = 4n - 1\)
hence, \( n^{th} \) term of the given AP is \( 4n - 1 \).

Q28

Total number of cards in a deck of cards = 52

Therefore, Total number of outcomes = 52

(i) let A denote the event of getting a king of red colour.

There are two cards in favour of getting a king of red colour i.e., king of heart and king of diamond.

Number of outcomes in favour of event A = 2

\[ P(A) = \frac{\text{Outcomes in favour of event A}}{\text{Total number of outcomes}} = \frac{2}{52} = \frac{1}{26} \]

(ii) let B denote the event of getting a face card.

There are 12 cards in favour of getting a face card i.e., 4 King, 4 Queen and 4 Jack cards.

Number of outcomes in favour of event B = 12

\[ P(B) = \frac{\text{Outcomes in favour of event B}}{\text{Total number of outcomes}} = \frac{12}{52} = \frac{3}{13} \]

(iii) let C denote the event of getting a queen of diamond.

There is one queen of diamond in the deck of cards.

\[ P(C) = \frac{\text{Outcomes in favour of event C}}{\text{Total number of outcomes}} = \frac{1}{52} \]

Q29

Let the height of the bucket be \( h \) cm.

Suppose \( r_1 \) and \( r_2 \) be the radii of the circular ends of the bucket.

Given, \( r_1 = 28 \) cm and \( r_2 = 21 \) cm

Capacity of bucket = 28.49 litres

\[ \because \text{Volume of the bucket} = 28.49 \times 1000 \text{ cm}^3 \quad [1 \text{ litre} = 1000 \text{ cm}^3] \]

\[ \Rightarrow \frac{1}{3} \pi h(r_1^2 + r_2^2 + r_1r_2) = 28.49 \times 1000 \text{ cm}^3 \]

\[ \Rightarrow \frac{1}{3} \times \frac{22}{7} \times h [(28)^2 + (21)^2 + (28 \times 21)] \text{ cm}^2 = 28490 \text{ cm}^3 \]

\[ \Rightarrow \frac{22}{21} \times h \times 1813 = 28490 \text{ cm} \]
Thus, the height of the bucket is 15 cm.

Q30

Let AB be the hill and CD be the tower.

Angle of elevation of the hill at the foot of the tower is 60°. i.e., \( \angle ADB = 60° \) and the angle of depression of the foot of hill from the top of the tower is 30°, i.e., \( \angle CBD = 30° \).

Now in right angled \( \triangle CBD \) :

\[
\tan 30° = \frac{CD}{BD}
\]

\[\Rightarrow BD = \frac{CD}{\tan 30°} \]

\[\Rightarrow BD = \frac{50}{\sqrt{3}} \]

\[\Rightarrow BD = 50\sqrt{3} \text{ m} \]

In right \( \triangle ABD \) :

\[
\tan 60° = \frac{AB}{CD}
\]

\[\Rightarrow AD = BD \times \tan 60° \]

\[= 50\sqrt{3} \times \sqrt{3} \text{ m}
\]

\[= 50 \times 3 \text{ m}
\]

\[= 150 \text{ m} \]

Hence, the height of the hill is 150 m.
Given : A circle \((O,r)\) and a tangent \(l\) at point \(A\).

To prove : \(OA \perp l\)

Construction : take any point \(B\) other than \(A\) on the tangent \(l\). Join \(OB\).

Suppose \(OB\) meets the circle at \(C\).

Proof : Among all line segments joining the centre \(O\) to any point on \(l\), the perpendicular is the shortest to \(l\).

So, in order to prove \(OA \perp l\) we need to prove that \(OA\) is shorter than \(OB\).

\(OA = OC\) (Radius of same circle)

Now, \(OB = OC + BC\)

\(\Rightarrow OB > OC\)
\(\Rightarrow OB > OA\)
\(\Rightarrow OA > OB\)

\(B\) is an arbitrary point on the tangent \(l\). thus, \(OA\) is shorter than any other line segment joining \(O\) to any point on \(l\).

Hence \(OA\) is perpendicular to \(l\).
Let the sides of the quadrilateral ABCD touch the circle at points P, Q, R and S as shown in the figure.

We know that, tangents drawn from an external point to the circle are equal in length.

Therefore,

\[
\begin{align*}
AP &= AS \\
BP &= BQ \\
CQ &= CR \\
DR &= DS
\end{align*}
\]  

\[\text{....(1)}\]

Therefore,

\[
\begin{align*}
AB + CD &= (AP + BP) + (CR + DR) \\
&= (AS + BQ) + (CQ + DS) \quad \text{[Using (1)]} \\
&= (AS + DS) + (BQ + CQ) \\
&= AD + BC
\end{align*}
\]

Hence, \(AB + CD = AD + BC\)

Q32

Let the number of books purchased by the shopkeeper be \(x\).

Cost price of \(x\) books = Rs 80

∴ Original cost price of one book = Rs \(\frac{80}{x}\)

If the shopkeeper had purchased 4 more books, then the number of books purchased by him would be \((x+4)\).

∴ New cost price of one book = Rs \(\frac{80}{x+4}\)

Given, Original cost price of one book – New cost price of one book = Rs 1
\[
\frac{80}{x} - \frac{80}{x+4} = 1
\]

\[
\Rightarrow \frac{80(x+4)-80x}{x(x+4)} = 1
\]

\[
80x + 320 - 80x = x(x+4)
\]

\[
x^2 + 4x = 320
\]

\[
x^2 + 4x - 320 = 0
\]

\[
x^2 + 20x - 16x - 320 = 0
\]

\[
x(x+20) - 16(x+20) = 0
\]

\[
(x-16)(x+20) = 0
\]

\[
x = 16 \text{ or } x = -20
\]

\[
\therefore x = 16 \quad \text{(because number of books cannot be negative)}
\]

OR

Let the first number be \(x\).

Given: First number + Second number = 9

\[
\therefore x + \text{Second number} = 9
\]

\[
\Rightarrow \text{Second number} = 9 - x
\]

Given,

\[
\frac{1}{\text{First number}} + \frac{1}{\text{Second number}} = \frac{1}{2}
\]

\[
\Rightarrow \frac{9-x+x}{x(9-x)} = \frac{1}{2}
\]

\[
9 \times 2 = 9x - x^2
\]

\[
x^2 - 9x + 18 = 0
\]

\[
x^2 - 6x - 3x + 18 = 0
\]

\[
x(x-6) -3(x-6) = 0
\]

\[
(x-3)(x-6) = 0
\]

\[
x = 3 \text{ or } x = 6
\]

when \(x = 3\), we have

\[
9-x = 9-3 = 6
\]

When \(x=6\), we have

\[
9-x = 9-6 = 3
\]
Thus, the two numbers are 3 and 6.

Q33
First term of the A.P (a) = 7; sum of first 20 terms = −240.

The sum of first n terms of an AP, Sn = \( \frac{n}{2} \left[ 2a + (n - 1)d \right] \), where a is the first term and d is the common difference.

\[ \therefore S_{20} = \frac{20}{2} \left[ 2 \times 7 + (20-1)d \right] = -240 \]
\[ \Rightarrow 10 \left[ 14 + 19d \right] = -240 \]
\[ \Rightarrow 14 + 19d = -24 \]
\[ \Rightarrow 19d = -24 - 14 \]
\[ \Rightarrow 19d = -38 \]
\[ \Rightarrow d = -2 \]

now, 24th term of the AP, \( a_{24} = a+(24-1)d \)
on putting respective values of a and d, we get
\[ a_{24} + 7 + 23 \times (-2) = 7 - 46 = -39 \]
hence, 24th term of the given AP is -39.

Q34
Let r and h be radius and height of the cone respectively.

Radius of cone \( (r) = 7 \) cm (Given)

Diameter of cone = \( 2 \times r = (2 \times 7) \) cm = 14 cm
According to the question, height of the cone is equal to its diameter.

∴ Height of cone (h) = 14 cm

Radius of hemisphere = Radius of cone = 7 cm

∴ Volume of solid = Volume of cone + Volume of hemisphere

\[
\frac{1}{3} \pi r^2 h + \frac{2}{3} \pi r^3
\]

\[
= \frac{\pi r^2}{3} [h + 2r]
\]

\[
= \frac{1}{3} \times \frac{22}{7} \times 7 \times 7 \times [14 + (2 \times 7)] \text{cm}^3
\]

\[
= \frac{22}{3} \times 7 \times 28 \text{cm}^3
\]

\[
= \frac{4312}{2} \text{cm}^3
\]

\[
= 1437.33 \text{cm}^3
\]

Thus, the volume of the solid is 1437.33 cm³.
