CBSE Class 12 Physics Question Paper Solution 2017
### OR

Two important limitations of Rutherford nuclear model 1+1

1. According to Rutherford model, electron orbiting around the nucleus, continuously radiates energy due to the acceleration; hence the atom will not remain stable. 1
2. As electron spirals inwards; its angular velocity and frequency change continuously; therefore it will emit a continuous spectrum. 2

### Q8

Calculation of wavelength of electron in ground state 2

Radius of ground state of hydrogen atom = 0.53Å = 0.53 x 0.53

According to de Broglie relation

For ground state \( n=1 \)

\[
2 \times 3.14 \times 0.53 \times 10^{-10} = 1 \text{ x m}
\]

Alternatively

Velocity of electron, in the ground state, of hydrogen atom = 2.

Hence momentum of revolving electron

\[
p = mv
\]

\[
= 9.
\]

- __________ m

\[
\text{m}
\]

[Note: Also accept the following answer:

Let be the wavelength of the electron in the orbit, we then have 1

For ground state n=1 1

\((r=r_0 \text{ is the radius of the ground state}) \)

[Alternatively 1

and (velocity of electron in ground state) 1 2]
### Q9

<table>
<thead>
<tr>
<th>Definition of magnifying power</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason for short focal lengths of objective and eyepiece</td>
<td>1</td>
</tr>
</tbody>
</table>

Magnifying power is defined as the angle subtended at the eye by the image to the angle subtended (at the unaided eye) by the object.

(Alternatively: Also accept this definition in the form of formula)

To increase the magnifying power both the objective and eyepiece must have short focal lengths \( \frac{1}{2} + \frac{1}{2} \) 2

### Q10

<table>
<thead>
<tr>
<th>Name of basic mode of communication</th>
<th>( \frac{1}{2} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of wave propagation</td>
<td>( \frac{1}{2} )</td>
</tr>
<tr>
<td>Range of frequencies and reason</td>
<td>( \frac{1}{2} + \frac{1}{2} )</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Broadcast / point to point, mode of communication</th>
<th>( \frac{1}{2} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space wave propagation</td>
<td>( \frac{1}{2} )</td>
</tr>
<tr>
<td>Above 40 MHz</td>
<td>( \frac{1}{2} )</td>
</tr>
</tbody>
</table>

Because e.m. waves, of frequency above 40MHz, are not reflected back by the ionosphere / penetrate through the ionosphere.

### SECTION C

### Q11

| (i) Calculation of phase difference between current and voltage | 1 |
| Name of quantity which leads | \( \frac{1}{2} \) |
| (ii) Calculation of value of ‘C’, is to be connected in parallel | 1 \( \frac{1}{2} \) |

(i) \[ \Omega = 100 \Omega \]

\[ \frac{\text{Name of quantity}}{\text{as}} = \frac{\text{500}}{\text{as}} \]

\[ \text{Phase angle} = -1 \]

\[ \text{As (phase angle is negative), hence current leads voltage} \]

(ii) To make power factor unity \[ \frac{\text{100}}{\text{as}} \]
**Q12**

<table>
<thead>
<tr>
<th>Names of the two processes</th>
<th>Diffusion</th>
<th>Drift</th>
<th>Diagram</th>
<th>Explanation of formation of depletion region and Barrier Potential</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>½</td>
<td>½</td>
<td>1</td>
<td>½ + ½</td>
</tr>
</tbody>
</table>

Due to the diffusion of electrons and holes across the junction, a region of (immobile) positive charge is created on the n-side and a region of (immobile) negative charge is created on the p-side, near the junction; this is called depletion region.

Barrier potential is formed due to loss of electrons from n-region and gain of electrons by p-region. Its polarity is such that it opposes the movement of charge carriers across the junction.

**Q13**

<table>
<thead>
<tr>
<th>(i) Derivation of the expression for cyclotron frequency</th>
<th>2</th>

<td>( \frac{1}{2} )</td>
</tr>
<tr>
<td></td>
<td>Photoelectric emission</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
</tr>
<tr>
<td></td>
<td>Effect produced</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
</tr>
</tbody>
</table>

(i) Einstein’s Photoelectric equation is
When a photon of energy \( \hbar \) is incident on the metal, some part of this energy is utilized as work function to eject the electron and remaining energy appears as the kinetic energy of the emitted electron.

\( V = 3.77 \text{ eV} \)

The work function of Mo and Ni is more than the energy of the incident photons; so photoelectric emission will not take place from these metals. Kinetic energy of photo electrons will not change, only photoelectric current will change.

\[ \frac{}{2} \]
\[ \frac{}{2} \times \frac{}{2} \]
\[ \frac{}{2} \]

Q16

Definition of amplitude modulation 1
Explanation of two factors justifying the need of modulation 2

It is the process of superposition of information/message signal over a carrier wave in such a way that the amplitude of carrier wave is varied according to the information signal/message signal.

Direct transmission, of the low frequency base band information signal, is not possible due to the following reasons;

(i) Size of Antenna: For transmitting a signal, minimum height of antenna should be \( \frac{}{2} \); with the help of modulation wavelength of signal decreases, hence height of antenna becomes manageable.

(ii) Effective power radiated by an antenna:
Effective power radiated by an antenna varies inversely as \( \frac{}{2} \), hence effective power radiated into the space, by the antenna, increases.

(iii) To avoid mixing up of signals from different transmitters.
(Any two)

Q17

(i) Calculation of equivalent capacitance 1
(ii) Calculation of charge and energy stored 1+1

(i) Capacitors are in parallel
\[ \frac{}{2} \mu F \]

Capacitors are in series
\[ \frac{}{2} \mu F \]
\[ \frac{}{2} \mu F \]

(ii) Charge drawn from the source
Q = \text{eq } V, \\
= -\mu C + \mu C \\
\text{Energy stored} = \frac{1}{2} \mu J \\
\Rightarrow 21 \mu J \\

(i) Derivation of expression of electric field on the equatorial line of the dipole \[ \frac{1}{2} + \frac{1}{2} \]

(ii) Depiction of orientation for stable and unstable equilibrium \[ \frac{1}{2} + \frac{1}{2} \]

Let the point ‘P’ be at a distance ‘r’ from the mid point of the dipole.

\[ \frac{1}{2} \]

Both are equal and their directions are as shown in the figure. Hence net electric field

\[ \frac{1}{2} \]

(iii) Stable equilibrium,

\[ \frac{1}{2} \]

Unstable equilibrium,
### Q19

(i) Determining the mass and atomic number of $A_4$ and $A_\frac{1}{2} \times 4$  

(ii) Basic nuclear processes of $\beta^+$ and $\beta^-$ decays $\frac{1}{2} + \frac{1}{2}$

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
| (i) | A_4 : Mass Number : 172  
      Atomic Number : 69  
      (ii) A : Mass Number : 180  
      Atomic Number : 72  |  \( \frac{1}{2} \) |  \( \frac{1}{2} \) |

[Alternatively: Give full credit if student considers \( \beta^+ \) decay and find atomic and mass numbers accordingly]

Gives the values quoted above.  

If the student takes $\beta^+$ decay

This would give the answers: \( (A_4 : 172,69);(A : 180,74) \)  

Basic nuclear process for $\beta^+$ decay $p$  

For $\beta^-$ decay $n$  

[Note: Give full credit of this part, if student writes the processes as conversion of proton into neutron for $\beta^+$ decay and neutron into proton for $\beta^-$ decay.]

### Q20

(i) Calculation of speed of light $1 \frac{1}{2}$  

(ii) Calculation of angle of incidence at face AB $1 \frac{1}{2}$

<p>| | | |</p>
<table>
<thead>

<td>(ii)</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{2} )</td>
</tr>
</tbody>
</table>

Also $\text{m/s} = 2.122$  

\[ \text{Also } \frac{1}{2} \text{m/s} \]

Page 8 of 16
At face AC, let the angle of incidence be \( r_2 \). For grazing ray, \( e = \frac{\pi}{2} \). Let angle of refraction at face AB be \( r_1 \). Now \( e = 60^\circ \). Let angle of incidence at this face be \( i \).

\[
\begin{align*}
\text{Q21} & \quad \text{Calculation of collector current and input} \quad 1+1+1 \\
\text{Given} & \quad =2k\Omega \\
& \quad = 2 \times 3\Omega \\
& \quad \frac{1}{2}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{Current gain} \\
& \quad \frac{1}{2}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{Input signal voltage} \\
& \quad = 1 \times 10^{-5} \times 10^3\Omega \\
& \quad =10 \quad \frac{1}{2}
\end{align*}
\]

\[\text{Note: Give full credit if student calculates the required quantities by any other alternative method}\]

\[
\begin{align*}
\text{Q22} & \quad \text{Working Principle of moving coil galvanometer} \quad 1 \\
& \quad \text{Necessity of (i) radial magnetic field} \quad \frac{1}{2} \\
& \quad \text{(ii) cylindrical soft iron core} \quad \frac{1}{2} \\
& \quad \text{Expression for current sensitivity} \quad \frac{1}{2} \\
& \quad \text{Explanation of use of Galvanometer to measure current} \quad \frac{1}{2}
\end{align*}
\]
When a coil, carrying current, and free to rotate about a fixed axis, is placed in a uniform magnetic field, it experiences a torque (which is balanced by a restoring torque of suspension).

(i) To have deflection proportional to current / to maximize the deflecting torque acting on the current carrying coil.
(ii) To make magnetic field radial / to increase the strength of magnetic field.

Expression for current sensitivity

\[ B = \frac{\text{deflection of the coil}}{\text{No}} \]

where \( B \) is the deflection of the coil

No

The galvanometer, can only detect currents but cannot measure them as it is not calibrated. The galvanometer coil is likely to be damaged by currents in the (mA/A) range.

**OR**

<table>
<thead>
<tr>
<th>1</th>
<th>½</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Definition of self inductance and its SI unit</td>
<td>1 + ½</td>
<td>½</td>
</tr>
<tr>
<td>b) Derivation of expression for mutual inductance</td>
<td>1 ½</td>
<td>½</td>
</tr>
</tbody>
</table>

Self inductance of a coil equals, the magnitude of the magnetic flux, linked with it, when a unit current flows through it.

Alternatively

Self inductance, of a coil, equals the magnitude of the emf induced in it, when the current in the coil, is changing at a unit rate.

SI unit : henry / (weber/ampere) / (ohm second.)

When current \( I_2 \) is passed through coil \( S_2 \), it in turn sets up a magnetic flux through \( S_1 : \Phi \)

But

[Note : If the student derives the correct expression, without giving the diagram of two coaxial coils, full credit can be given]
**SECTION D**

Q23

a) Two qualities each of Anuja and her mother ½ x 4
   Anuja : Scientific temperament, co-operative, knowledgeable (any two)
   Mother : Inquisitive, scientific temper/keen to learn/has no airs(any two)(or any other two similar values)

b) Explanation, using lens maker’s formula 2
   As the refractive index of plastic material is less than that of glass material therefore, for the same power (= ), the radius of curvatures of plastic material is small.
   Therefore plastic lens is thicker.
   Alternatively, If student just writes that plastic has a different refractive index than glass, award one mark for this part.

**SECTION E**

Q24

a) Labelled diagram of AC generator 1 ½
   Expression for instantaneous value of induced emf. 1 ½

b) Calculation of maximum value of current 2

[Diagram of AC generator]

[Deduct ½ mark, If diagram is not labeled]

When the coil is rotated with constant angular speed \( \omega \), the angle \( \theta \) between the magnetic field and area vector of the coil, at instant \( t \), is given by \( \theta = \omega t \).

Therefore, magnets flux, \( (\phi_B) \), at this instant, is

\[ = BA \cos \omega t \]

\[ \therefore \text{Induced emf} \quad e = -N - \]

\[ = NBA \omega \sin \omega t \]

\[ e = e_o \sin \omega t \]

where \( e_o = NBA \)

b) Maximum value of emf

\[ = NBA \omega \]

\[ = 20 \times 200 \times 3 \times 50 \] V

\[ = 600 \text{ mV} \]
Maximum induced current = ——— mA

[Note 1: If the student calculates the value of the maximum induced emf and says that “since R is not given, the value of maximum induced current cannot be calculated”, the ½ mark, for the last part, of the question, can be given.]
[Note 2: The direction of magnetic field has not been given. If the student takes this direction along the axis of rotation and hence obtains the value of induced emf and, therefore, maximum current, as zero, award full marks for this part.]

OR

a) Labelled diagram of a step up transformer 1 ½
   Derivation of ratio of secondary and primary voltage 2
b) Calculation of number of turns in the secondary 1 ½

Alternatively

[Note: Deduct ½ mark, if labeling is not done]

a) When ac voltage is applied to primary coil the resulting current produces an alternating magnetic flux, which also links the secondary coil.
   The induced emf, in the secondary coil, having \( N_s \) turns, is
   __________

   This flux, also induces an emf, called back emf, in the primary coil.
   __________

   But and
   __________ = __________
For an ideal transformer

\[ V = \frac{V_2}{V_1} = \frac{I_2}{I_1} = \frac{300}{\frac{1}{2}} = 300 \]

\[ \frac{1}{2} \quad \frac{1}{2} \]

\[ \frac{1}{2} \quad \frac{1}{2} \]

\[ \frac{1}{2} \quad \frac{1}{2} \quad 5 \]

Q25

a) Distinction between unpolarised and linearly polarized light

Obtaining linearly polarized Light 2

b) Calculation of intensity of light 1

a) In an unpolarized light, the oscillations of the electric field are in random directions, in planes perpendicular to the direction of propagation. For a polarized light, the oscillations are aligned along one particular direction.

Alternatively

Polarized light can be distinguished from unpolarized light, when it is allowed to pass through a polaroid. Polarized light does can show change in its intensity, on passing through a Polaroid; intensity remains same in case of unpolarized light.

When unpolarised light wave is incident on a polaroid, then the electric vectors along the direction of its aligned molecules, get absorbed; the electric vector, oscillating along a direction perpendicular to the aligned molecules, pass through. This light is called linearly polarized light.

b) According to Malus’ Law:

\[ I = \frac{I_0}{2} \]

\[ \therefore I = \frac{1}{2}, \quad \theta, \text{ where } \theta \text{ is the intensity of unpolarized light.} \]

(given)

\[ I = \frac{1}{2} \quad \frac{1}{2} \quad \frac{1}{2} \]

Page 13 of 16
OR

a) Explanation of two features (distinguishing between interference pattern and diffraction pattern.)
   1) All fringes are of equal width.
   2) Intensity of all bright bands is equal.

b) Calculation of angular width of central maxima
   1) Width of central maxima is twice the width of higher order bands.
   2) Intensity goes on decreasing for higher order of diffraction bands.

[Note: Also accept any other two correct distinguishing features.]

b) Angular width of central maximum

   \[
   \frac{1}{2} \quad \frac{1}{2} \quad 1
   \]

Linear width of central maxima in the diffraction pattern

Let ‘n’ be the number of interference fringes which can be accommodated in the central maxima

\[
\frac{1}{2}
\]

[Award the last \(\frac{1}{2}\) mark if the student writes the answers as 2 (taking \(d = a\)), or just attempts to do these calculation.]

Q26

i. Derivation of the expression for drift velocity
   Deduction of Ohm’s law

ii. Name of quantity and justification

\[
\frac{1}{2} + \frac{1}{2}
\]
Let an electric field $E$ be applied to the conductor. Acceleration of each electron is

Velocity gained by the electron

Let the conductor contain $n$ electrons per unit volume. The average value of time, between their successive collisions, is the relaxation time,

Hence average drift velocity

The amount of charge, crossing area $A$, in time $\Delta t = 1\Delta$, is

Substituting the value of $v_d$, we get

But $I = JA$, where $J$ is the current density

$J = \frac{\Delta I}{\Delta t} = \sigma E$

This is Ohm’s law

[Note: Credit should be given if the student derives the alternative form of Ohm’s law by substituting $E = \frac{\Delta V}{\Delta t}$]

ii) Electric current well remain constant in the wire.
   All other quantities, depend on the cross sectional area of the wire.

---

| (i) Statement of Kirchoff’s laws | 1+1 |
| Justification | $\frac{1}{2} + \frac{1}{2}$ |
| (ii) Calculation of | i) current drawn and | 1 |
| | ii) Power consumed | 1 |

(i) Junction Rule: At any Junction, the sum of currents, entering the junction, is equal to the sum of currents leaving the junction.

Loop Rule: The Algebraic sum, of changes in potential, around any closed loop involving resistors and cells, in the loop is zero.

$V) = 0$

Justification: The first law is in accord with the law of conservation of charge.

The Second law is in accord with the law of conservation of energy.

ii) Equivalent resistance of the loop

---

Page 15 of 16
\[
R = \frac{r}{R'}
\]

Hence current drawn from the cell
\[
I = \frac{1}{r} = --
\]

Power consumed \( P = (\frac{r}{3}) \)

\[
= -- \times -- = --
\]

[Note: Award the last 1 \( \frac{1}{2} \) marks for this part, if the calculations, for these parts, are done by using (any other) value of equivalent resistance obtained by the student.]

### Q9

| Definition of distance of closest approach | 1 |
| Finding of distance of closest approach when kinetic energy is doubled | 1 |

It is the distance of charged particle from the centre of the nucleus, at which the whole of the initial kinetic energy of the (far off) charged particle gets converted into the electric potential energy of the system. Distance of closest approach \((r_c)\) is given by

\[
\frac{1}{2} - \frac{1}{2}
\]

‘K’ is doubled, \(\therefore r_c\) becomes –

\[
\frac{1}{2}
\]

[Alternatively: If a candidate writes directly – without mentioning formula, award the 1 mark for this part.]

**OR**

| Two important limitations of Rutherford nuclear model | 1+1 |

1. According to Rutherford model, electron orbiting around the nucleus, continuously radiates energy due to the acceleration; hence the atom will not remain stable.  
   1

2. As electron spirals inwards; its angular velocity and frequency change continuously; therefore it will emit a continuous spectrum.  
   2

\( \text{ii. } A : \text{Mass Number} : 180 \text{ Atomic Number} : 72 \) \( \frac{1}{2} \)

[Alternatively: Give full credit if student considers decay and find atomic and mass numbers accordingly]

Gives the values quoted above.

If the student takes \( \beta^+ \) decay

This would give the answers: \( (A_4:172,69);(A:180,74) \] \( \frac{1}{2} \)

Basic nuclear process for \( \beta^+ \) decay \( p \)

For \( \beta^- \) decay \( n \)

[Note: Give full credit of this part, if student writes the processes as conversion of proton into neutron for decay and neutron into proton for decay.] \( \frac{3}{3} \)
When a coil, carrying current, and free to rotate about a fixed axis, is placed in a uniform magnetic field, it experiences a torque (which is balanced by a restoring torque of suspension).

(i) To have deflection proportional to current / to maximize the deflecting torque acting on the current carrying coil.
(ii) To make magnetic field radial / to increase the strength of magnetic field.

Expression for current sensitivity

\[ \theta \]

where \( \theta \) is the deflection of the coil

No

The galvanometer, can only detect currents but cannot measure them as it is not calibrated. The galvanometer coil is likely to be damaged by currents in the (mA/A) range

OR

a) Definition of self inductance and its SI unit

\[ 1 + \frac{1}{2} \]

b) Derivation of expression for mutual inductance

\[ 1 \frac{1}{2} \]

Self inductance of a coil equals, the magnitude of the magnetic flux, linked with it, when a unit current flows through it.

Alternatively

Self inductance, of a coil, equals the magnitude of the emf induced in it, when the current in the coil, is changing at a unit rate.

SI unit : henry / (weber/ampere) / (ohm second.)

\[ \frac{1}{2} \]

When current \( I_2 \) is passed through coil \( S_2 \), it in turn sets up a magnetic flux through \( S_1 \): \( \Phi \)

But
Q17 | Calculation of collector current and input
---|---
Given | $2\,\text{k}\Omega = 2 \times 3\,\Omega$
| \[= 1\,\text{mA}\]
current gain | \[1+1+1\]
Input signal voltage | \[1 \times 10^{-5} \times 10^3\,\Omega = 10\]

[Note: Give full credit if student calculates the required quantities by any other alternative method]

Q18 | Explanation of heavily doping of both p and n sides of Zener diode
---|---
Circuit diagram of Zener diode as a dc voltage regulator
Explanation of the use of Zener diode as a dc voltage regulator

By heavily doping both p and n sides of the junction, depletion region formed is very thin, i.e. $< 10^{-6}$ m. Hence, electric field, across the junction is very high ($\sim 5 \times 10^6$ V/m) even for a small reverse bias. This can lead to a ‘breakdown’ during reverse biasing.

If the input voltage increases/decreases, current through resistor $R$, and Zener diode, also increases/decreases. This increases/decreases the voltage drop across \[\text{Zener diode}\].

This is because, in the breakdown region, Zener voltage remains constant even though the current through the Zener diode changes.
Q19

(i) Calculation of phase difference between current and voltage 1
Name of quantity which leads ½
(ii) Calculation of value of ‘C’, is to be connected in parallel 1 ½

——— = -1

As , (phase angle is negative), hence current leads voltage ½

ii. To make power factor unity

——= 100

Q20

| Definition of amplitude modulation | 1 |
| Explanation of two factors justifying the need of modulation | 2 |

It is the process of superposition of information/message signal over a carrier wave in such a way that the amplitude of carrier wave is varied according to the information signal/message signal.

Direct transmission, of the low frequency base band information signal, is not possible due to the following reasons;

(i) Size of Antenna: For transmitting a signal, minimum height of antenna should be −, with the help of modulation wavelength of signal decreases, hence height of antenna becomes manageable.

(ii) Effective power radiated by an antenna:
Effective power radiated by an antenna varies inversely as $\lambda^2$, hence effective power radiated into the space, by the antenna, $\frac{1}{2} + \frac{1}{2}$
Electron, in circular motion around the nucleus, constitutes a current loop which behaves like a magnetic dipole. Current associated with the revolving electron:

- and 

Magnetic moment of the loop,

Orbital angular momentum of the electron, \( L = \) 

-ve sign signifies that the angular momentum of the revolving electron is opposite in direction to the magnetic moment associated with it.
\[ V = \quad \] ½

[Note: Also accept any other alternative correct method.]

| Q23 | a) Two qualities each of Anuja and her mother \( \frac{1}{2} \times 4 \) | \( \frac{1}{2} + \frac{1}{2} \) |
|     | b) Explanation, using lens maker’s formula 2 | \( \frac{1}{2} + \frac{1}{2} \) |
| Q24 | a) Distinction between unpolarised and linearly polarized light 2 | \( \frac{1}{2} \) |
|     | Obtaining linearly polarized Light 1 | \( \frac{1}{2} \) |
|     | b) Calculation of intensity of light 2 | \( \frac{1}{2} \) |

a) Anuja: Scientific temperament, co-operative, knowledgeable (any two)
Mother: Inquisitive, scientific temper/keen to learn/ has no airs (any two) (or any other two similar values)

As the refractive index of plastic material is less than that of glass material, therefore, for the same power (\( = \) ), the radius of curvatures of plastic material is small. Therefore plastic lens is thicker.

Alternatively, If student just writes that plastic has a different refractive index than glass, award one mark for this part.

b) – – – – – – – –

b) – – – – – – – –

As the refractive index of plastic material is less than that of glass material, therefore, for the same power (\( = \) ), the radius of curvatures of plastic material is small. Therefore plastic lens is thicker.

Alternatively, If student just writes that plastic has a different refractive index than glass, award one mark for this part.

a) In an unpolarized light, the oscillations of the electric field, are in random directions, in planes perpendicular to the direction of propagation. For a polarized light, the oscillations are aligned along one particular direction.

Alternatively

Polarized light can be distinguished, from unpolarized light, when it is allowed to pass through a polaroid. Polarized light does show change in its intensity, on passing through a polaroid; intensity remains same in case of unpolarized light.
When unpolarised light wave is incident on a polaroid, then the electric vectors along the direction of its aligned molecules, get absorbed; the electric vector, oscillating along a direction perpendicular to the aligned molecules, pass through. This light is called linearly polarized light.

b) According to Malus’ Law:

\[ I = \left( \frac{I_0}{I_0} \right)^2 \]

\[ \therefore I = \left( \frac{I_0}{I_0} \theta \right) \text{ where } \theta \text{ is the intensity of unpolarized light.} \]

(given)

\[ I = \left( \frac{I_0}{I_0} \right)^2 = \left( \frac{I_0}{I_0} \right)^\frac{1}{2} \]

\[ = \left( \frac{I_0}{I_0} \right)^\frac{1}{2} \]

OR

a) Explanation of two features (distinguishing between interference pattern and diffraction pattern.)

<table>
<thead>

Let an electric field \(E\) be applied the conductor. Acceleration of each electron is

Velocity gained by the electron

Let the conductor contain \(n\) electrons per unit volume. The average value of time, between their successive collisions, is the relaxation time,

Hence average drift velocity

The amount of charge, crossing area \(A\), in time \(\Delta t\) is

Substituting the value of \(\nu_d\), we get

But \(I = JA\), where \(J\) is the current density

\[ J = \frac{\Delta q}{\Delta t} \]

\(\Rightarrow J = \sigma E\)

This is Ohm’s law

[Note: Credit should be given if the student derives the alternative form of Ohm’s law by substituting \(E = -\)]

ii) Electric current well remain constant in the wire.

All other quantities, depend on the cross sectional area of the wire.

**OR**
(i) Junction Rule: At any Junction, the sum of currents, entering the junction, is equal to the sum of currents leaving the junction.

Loop Rule: The Algebraic sum, of changes in potential, around any closed loop involving resistors and cells, in the loop is zero.

\[ V \] = 0

Justification: The first law is in accord with the law of conservation of charge.
The Second law is in accord with the law of conservation of energy.

(ii) Equivalent resistance of the loop

\[ R = \frac{R}{3} \]

Hence current drawn from the cell

\[ I = \frac{V}{R} = \frac{1}{2} \]

Power consumed \( P = \frac{I^2 R}{3} \)

\[ = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \]

[Note: Award the last 1 ½ marks for this part, if the calculations, for these parts, are done by using (any other) value of equivalent resistance obtained by the student.)

Q26

a) Labelled diagram of AC generator

Expression for instantaneous value of induced emf. 1 ½

b) Calculation of maximum value of current 2
When the coil is rotated with constant angular speed $\omega$, the angle $\theta$ between the magnetic field and area vector of the coil, at instant $t$, is given by $\theta = \omega t$.

Therefore, magnets flux, ($\phi_B$), at this instant, is

$$\phi_B = BA \cos \omega t$$

Induced emf $e = -N\dot{\phi} = NBA \omega \sin \omega t$

where $e_0 = NBA$

b) Maximum value of emf

$$e = NBA \omega$$

$$= 20 \times 200 \times 3 \times 50 V$$

$$= 600 mV$$

Maximum induced current $= \frac{600 mV}{2000}$

$$= 0.3 mA$$

[Note 1: If the student calculates the value of the maximum induced emf and says that “since R is not given, the value of maximum induced current cannot be calculated”, the $\frac{1}{2}$ mark, for the last part, of the question, can be given.]

[Note 2: The direction of magnetic field has not been given. If the student takes this direction along the axis of rotation and hence obtains the value of induced emf and, therefore, maximum current, as zero, award full marks for this part.]
When ac voltage is applied to primary coil the resulting current produces an alternating magnetic flux, which also links the secondary coil.

The induced emf, in the secondary coil, having \( N_2 \) turns, is

\[ \frac{1}{2} \]

This flux, also induces an emf, called back emf, in the primary coil.

\[ \frac{1}{2} \]

For an ideal transformer

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\( \Rightarrow \) \[ \frac{1}{2} \]

\( \frac{1}{2} \)

b) \[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

### Q10

| Explanation of flow of current through capacitor | 1 |
| Expression for displacement current | 1 |

During charging, electric flux between the plates of capacitor keeps on changing; this results in the production of a displacement current between the plates.

\[ I_d = \varepsilon_o \frac{d\varphi_E}{dt} \quad (I_d = \varepsilon_o A \frac{dE}{dt}) \]

### Q11

| Working Principle of moving coil galvanometer | 1 |
| Necessity of (i) radial magnetic field | \( \frac{1}{2} \) |
| (ii) cylindrical soft iron core | \( \frac{1}{2} \) |
| Expression for current sensitivity | \( \frac{1}{2} \) |
| Explanation of use of Galvanometer to measure current | \( \frac{1}{2} \) |

When a coil, carrying current, and free to rotate about a fixed axis, is placed in a uniform magnetic field, it experiences a torque (which is balanced by a restoring torque of suspension).

(i) To have deflection proportional to current / to maximize the deflecting torque acting on the current carrying coil.

(ii) To make magnetic field radial / to increase the strength of magnetic field.

Expression for current sensitivity

\[ I_s = \frac{\theta}{l} \quad \text{or} \quad \frac{NAB}{K} \]

where \( \theta \) is the deflection of the coil

No \( \frac{1}{2} \)

The galvanometer, can only detect currents but cannot measure them as it is not calibrated. The galvanometer coil is likely to be damaged by currents in the (mA/A) range

**OR**

a) Definition of self inductance and its SI unit \( 1 + \frac{1}{2} \)

b) Derivation of expression for mutual inductance \( 1 \frac{1}{2} \)

Self inductance of a coil equals, the magnitude of the magnetic flux, linked with it, when a unit current flows through it.

Alternatively

Self inductance, of a coil, equals the magnitude of the emf induced in it, when the current in the coil, is changing at a unit rate.

SI unit: henry / (weber/ampere) / (ohm second.) \( \frac{1}{2} \)
When current $I_2$ is passed through coil $S_2$, it in turn sets up a magnetic flux through $S_1$: $\Phi_1 = (n_1 \ell) (\pi r_1^2) (B_2)$

$\Phi_1 = (n_1 \ell) (\pi r_1^2) (\mu_0 n_2 l_2)$

But $\Phi_1 = M_{12} l_2$

$\Rightarrow M_{12} = \mu_0 n_1 n_2 \pi r_1^2 \ell$

[Note: If the student derives the correct expression, without giving the diagram of two coaxial coils, full credit can be given]

Q12

(i) Determining the mass and atomic number of $A_4$ and $A_{1/2}$

$\frac{1}{2} \times 4$

(ii) Basic nuclear processes of $\beta^+$ and $\beta^-$ decays

$\frac{1}{2} + \frac{1}{2}$

(i) $A_4$: Mass Number: 172

Atomic Number: 69

(ii) $A_{1/2}$: Mass Number: 180

Atomic Number: 72

[Alternatively: Give full credit if student considers $\beta^+$ decay and finds atomic and mass numbers accordingly]

$^1_{72}A \rightarrow ^{176}_{70}A_1 \rightarrow ^{176}_{71}A_2 \rightarrow ^{172}_{69}A_3 \rightarrow ^{172}_{69}A_4$

Gives the values quoted above.

If the student takes $\beta^+$ decay

$^1_{74}A \rightarrow ^{176}_{72}A_1 \rightarrow ^{176}_{71}A_2 \rightarrow ^{172}_{69}A_3 \rightarrow ^{172}_{69}A_4$

This would give the answers: ($A_4$; 172, 69); ($A_{1/2}$; 180, 74)]

Basic nuclear process for $\beta^+$ decay $p \rightarrow n + \frac{1}{2}e + \nu$

For $\beta^-$ decay $n \rightarrow p + \frac{1}{2}e + \bar{\nu}$

[Note: Give full credit of this part, if student writes the processes as conversion of proton into neutron for $\beta^+$ decay and neutron into proton for $\beta^-$ decay.]

Q13

Calculation of collector current $I_c$, base current $I_b$ and input signal voltage $V_i$

$1 + 1 + 1$

Given $R_c = 2k\Omega$

$= 2 \times 10^3 \Omega$

$\frac{1}{2}$
\[ V_{CE} = I_C R_C \]
\[ I_C = \frac{V_{CE}}{R_C} = \frac{2}{2 \times 10^3} A = 10^{-3} A = 1mA \]

**current gain**
\[ \beta = \frac{I_C}{I_B} \]
\[ \therefore 100 = \frac{10^{-3}}{I_B} \]
\[ \therefore I_B = 10^{-5} A \]

**Input signal voltage**
\[ V_i = I_B R_B = 1 \times 10^{-5} \times 10^3 \Omega = 10^{-2} V \]

[Note: Give full credit if student calculates the required quantities by any other alternative method]

</table>

(i) Maximum kinetic energy \((K_{max})\), of emitted electrons, depends linearly on frequency of incident radiations
\[ (KE)_{max} = h\nu - h\nu_o \]

Existence of threshold frequency for the metal surface \(\phi_0 = h\nu_o\)
Any other relevant feature

(ii) Since no photoelectric emission takes place from P it means frequency of incident radiation \((10^{15} \text{Hz})\) is less than its threshold frequency \((\nu_o)_p\).

Photo emission takes place from Q but kinetic energy of photoelectrons is zero. This implies that frequency of incident radiation is just equal to the threshold frequency of Q.

For Q, work function \(\phi_0 = h\nu_o\)
\[ = \frac{6.6 \times 10^{-34} \times 10^{15}}{1.6 \times 10^{-19}} eV \]
\[ = 4.125 eV \]

</table>

\[ X_L = \omega L = (1000 \times 100 \times 10^{-3}) \Omega = 100 \Omega \]
\[ X_C = \frac{1}{\omega C} = \left( \frac{1}{1000 \times 2 \times 10^{-6}} \right) \Omega = 500 \Omega \]

Phase angle
\[
\begin{align*}
\tan \Phi &= \frac{X_L - X_C}{R} \\
\tan \Phi &= \frac{100 - 500}{400} = -1 \\
\Phi &= \frac{\pi}{4}
\end{align*}
\]

As \( X_C > X_L \) (phase angle is negative), hence current leads voltage

(ii) To make power factor unity

\[
\begin{align*}
X_C' &= X_L \\
\frac{1}{wC} &= 100 \\
C' &= 10 \mu F
\end{align*}
\]

\[C' = C + C_1\]

\[10 = 2 + C_1\]

\[C_1 = 8 \mu F\]

Q16

(i) Obtaining of the expression for torque experienced by an electric dipole 2

(ii) Effect of non-uniform electric field 1

(i)

\[
\begin{align*}
\text{Force on } + q, \quad \vec{F} &= q \vec{E} \\
\text{Force on } - q, \quad \vec{F} &= -q \vec{E}
\end{align*}
\]

Magnitude of torque

\[
\tau = qE \times 2a \sin \theta = 2qaE \sin \theta
\]

\[\vec{t} = \vec{p} \times \vec{E}\]

(ii) If the electric field is non-uniform, the dipole experiences a translatory force as well as a torque.

Q17

Circuit diagrams of p n junction under forward bias and reverse bias \(\frac{1}{2} + \frac{1}{2}\)

Explanation of p n junction working for forward and reverse bias \(\frac{1}{2} + \frac{1}{2}\)

Characteristic curves for the two cases \(\frac{1}{2} + \frac{1}{2}\)
In forward bias, applied voltage does not support potential barrier. As a result, the depletion layer width decreases and barrier height is reduced. Due to the applied voltage, electrons from n side cross the depletion region and reach p side. Similarly holes from p side cross the junction and reach the n side. The motion of charged carriers, on either side, give rise to current.

In reverse bias, applied voltage support potential barrier. As a result, barrier height is increased, depletion layer widens. This suppresses the flow of electrons from n $\rightarrow$ p and holes from p $\rightarrow$ n. Diffusion current decreases. The electric field direction of the junction is such that if electrons on p side or holes on n side in their random motion comes close to the junction, they will be swept to its majority zone. This drift of carriers give rise to the current called reverse current.

<thead>
<tr>
<th>Q18</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Calculation of speed of light</td>
</tr>
<tr>
<td>(ii) Calculation of angle of incidence at face AB</td>
</tr>
</tbody>
</table>

\[ \mu = \frac{\sin\left(\frac{A + \delta m}{2}\right)}{\sin\left(\frac{A}{2}\right)} = \frac{\sin\left(\frac{60 + 30}{2}\right)}{\sin\left(\frac{60}{2}\right)} = \sqrt{2} \]

Also \( \mu = \frac{c}{\nu^2} \Rightarrow \nu = \frac{3 \times 10^8}{\sqrt{2}} \text{m/s} = 2.122 \times 10^8 \text{m/s} \]
At face AC, let the angle of incidence be \( r_2 \). For grazing ray, \( e = 90^\circ \)
\[
\Rightarrow \mu = \frac{1}{\sin r_2} \Rightarrow r_2 = \sin^{-1}\left(\frac{1}{\sqrt{2}}\right) = 45^\circ
\]
Let angle of refraction at face AB be \( r_1 \). Now \( r_1 + r_2 = A \)
\[
\therefore r_1 = A - r_2 = 60^\circ - 45^\circ = 15^\circ
\]
Let angle of incidence at this face be \( i \)
\[
\mu = \frac{\sin i}{\sin r_1}
\Rightarrow \sqrt{2} = \frac{\sin i}{\sin 15^\circ}
\]
\[
\therefore i = \sin^{-1}\left(\sqrt{2} \cdot \sin 15^\circ\right)
\]

**Q19**
- Definition of amplitude modulation: 1
- Explanation of two factors justifying the need of modulation: 2

It is the process of superposition of information/message signal over a carrier wave in such a way that the amplitude of carrier wave is varied according to the information signal/message signal.

Direct transmission, of the low frequency base band information signal, is not possible due to the following reasons:

(i) Size of Antenna: For transmitting a signal, minimum height of antenna should be \( \frac{\lambda}{4} \), with the help of modulation wavelength of signal decreases, hence height of antenna becomes manageable.

(ii) Effective power radiated by an antenna:

Effective power radiated by an antenna varies inversely as \( \lambda^2 \), hence effective power radiated into the space, by the antenna, increases.

(iii) To avoid mixing up of signals from different transmitters.

(Any two) 3

**Q20**
- Equivalent capacitance in series: ½
- Energy in series combination: ½
- Charge in series combination: ½
- Equivalent capacitance in parallel combination: ½
- Energy in parallel combination: ½
- Charge in parallel combination: ½
In series combination: \( \frac{1}{C_s} = \left( \frac{1}{12} + \frac{1}{12} \right)(pF)^{-1} \)
\[ \therefore C_s = 6 \times 10^{-12} \text{pF} \]

\[ U_s = \frac{1}{2}CV^2 \]
\[ U_s = \frac{1}{2} \times 6 \times 10^{-12} \times 50 \times 50 \text{ J} \]
\[ \therefore U_s = 75 \times 10^{-10} \text{J} \]

\[ q_s = C_s V \]
\[ = 6 \times 50 \]
\[ = 300 \times 10^{-12} \text{C} = 3 \times 10^{-10} \text{C} \]

In parallel combination: \( C_p = (12 + 12)\text{pF} \)
\[ \therefore C_p = 24 \times 10^{-12} \text{F} \]

\[ U_s = \frac{1}{2} \times 24 \times 10^{-12} \times 2500 \text{ J} \]
\[ = 3 \times 10^{-8} \text{J} \]

\[ q_p = C_p V \]
\[ q_p = 24 \times 10^{-12} \times 50 \text{ C} \]
\[ q_p = 1.2 \times 10^{-9} \text{C} \]

Q21
(a) Expression for force acting on charged particle \( q(\vec{v} \times \vec{B}) \)
(i) Condition for circular path \( \frac{1}{2} \)
(ii) Condition for helical path \( \frac{1}{2} \)
(b) Showing Kinetic energy is constant \( 1 \)

(a) When velocity of charged particle and magnetic field are perpendicular to each other.

(i) When velocity is neither parallel nor perpendicular to the
magnetic field.

(b) The force, experienced by the charged particle, is perpendicular to the instantaneous velocity \( \vec{v} \), at all instants. Hence the magnetic force cannot bring any change in the speed of the charged particle. Since speed remains constant, the kinetic energy also stays constant.

\[ \frac{1}{R_1} = \frac{1}{R} + \frac{1}{\left( R_0 \right)} \]

Effective resistance between points A & B

\[ R_2 = \left( \frac{R}{\left( R + \frac{R_0}{2} \right)} \right) + \frac{R_0}{2} \]

Current drawn from the voltage source,

\[ I = \frac{V}{R_2} \]

Let current through \( R \) be \( I_1 \)

\[ I_1 = \frac{1}{\left( \frac{R_0}{2} \right)} \frac{R + \frac{R_0}{2}}{R} \]

Voltage across \( R \)

\[ V_1 = I_1 R \]
\[ = \frac{IR_0}{2(R + \frac{R_0}{2})} \cdot R \]
\[ = \frac{V}{2\left( R + \frac{R_0}{2} \right)} \cdot \left( \frac{R R_0}{2R + R_0} + \frac{R_0}{2} \right) \]
\[ = \frac{2RV}{R_0 + 4R} \]

Q22

Derivation of expression of voltage across resistance \( R \) 3

Q23

a) Two qualities each of Anuja and her mother ½ x 4
b) Explanation, using lens maker’s formula 2

a) Anuja: Scientific temperament, co-operative, knowledgeable (any) ½+ ½
Mother: Inquisitive, scientific temper/keen to learn/has no airs (any two) (or any other two similar values)

\[ \frac{1}{f} = \left( \frac{n_2}{n_1} - 1 \right) \left( \frac{1}{r_1} - \frac{1}{r_2} \right) \]

As the refractive index of plastic material is less than that of glass material therefore, for the same power \((= \frac{1}{f})\), the radius of curvature of plastic material is small. Therefore plastic lens is thicker.

Alternatively, if student just writes that plastic has a different refractive index than glass, award one mark for this part.

Let an electric field \(E\) be applied to the conductor. Acceleration of each electron is

\[ a = -\frac{eE}{m} \]

Velocity gained by the electron

\[ v = -\frac{eE}{m} t \]

Let the conductor contain \(n\) electrons per unit volume. The average value of time \(t\), between their successive collisions, is the relaxation time, \(\tau\).

Hence average drift velocity

\[ v_d = \frac{-eE}{m} \tau \]

The amount of charge, crossing area \(A\), in time \(\Delta t\), is

\[ \equiv neA v_d \Delta t = I \Delta t \]

Substituting the value of \(v_d\), we get

\[ I \Delta t = neA \left( \frac{eE \tau}{m} \right) \Delta t \]

\[ \therefore I = \left( \frac{e^2 A n}{m} \right) E = \sigma E, \quad \left( \sigma = \frac{e^2 \tau n}{m} \right) \text{is the conductivity} \]

But \(I = JA\), where \(J\) is the current density

\[ \Rightarrow J = \left( \frac{e^2 \tau n}{m} \right) E \]

\[ \Rightarrow J = \sigma E \]

This is Ohm’s law

[Note: Credit should be given if the student derives the alternative form of Ohm’s law by substituting \(E = \frac{V}{t}\)]

ii) Electric current will remain constant in the wire.

All other quantities, depend on the cross-sectional area of the wire.

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]

\[ \frac{1}{2} \]
(i) Junction Rule: At any Junction, the sum of currents, entering the junction, is equal to the sum of currents leaving the junction. 

Loop Rule: The Algebraic sum, of changes in potential, around any closed loop involving resistors and cells, in the loop is zero. 

\[ \sum(\Delta V) = 0 \]

Justification: The first law is in accord with the law of conservation of charge. 
The Second law is in accord with the law of conservation of energy. 

(ii) Equivalent resistance of the loop 

\[ R = \frac{r}{3} \]

Hence current drawn from the cell 

\[ I = \frac{E}{\frac{r}{3} + r} = \frac{3E}{4r} \]

Power consumed 

\[ P = I^2 \left( \frac{r}{3} \right) \]

\[ = \frac{9E^2}{16r^2} \times \frac{4r}{3} = \frac{3E^2}{4r} \]

[Note: Award the last 1 ½ marks for this part, if the calculations, for these parts, are done by using (any other) value of equivalent resistance obtained by the student.) 

Q25 

a) Labelled diagram of AC generator 

Expression for instantaneous value of induced emf. 

b) Calculation of maximum value of current 

[Note: Award the last 1 ½ marks for this part, if the calculations, for these parts, are done by using (any other) value of equivalent resistance obtained by the student.) 

[Deduct ½ mark, If diagram is not labeled]
When the coil is rotated with constant angular speed $\omega$, the angle $\theta$ between the magnetic field and area vector of the coil, at instant $t$, is given by $\theta = \omega t$.

Therefore, magnets flux, $(\phi_B)$, at this instant, is $\phi_B = BA \cos \omega t$

\[ \therefore \text{Induced emf } e = -N \frac{d\phi_B}{dt} \]

\[ e = NBA \omega \sin \omega t \]

\[ e = e_o \sin \omega t \]

where $e_o = NBA \omega$

b) Maximum value of emf

\[ e_o = NBA \omega \]

\[ = 20 \times 200 \times 10^{-4} \times 3 \times 10^{-2} \times 50V \]

\[ = 600 \text{ mV} \]

Maximum induced current $i_o = \frac{e_o}{R} = \frac{600}{R} \text{mA}$

[Note 1: If the student calculates the value of the maximum induced emf and says that “since R is not given, the value of maximum induced current cannot be calculated”, the $\frac{1}{2}$ mark, for the last part, of the question, can be given.]

[Note 2: The direction of magnetic field has not been given. If the student takes this direction along the axis of rotation and hence obtains the value of induced emf and, therefore, maximum current, as zero, award full marks for this part.]

OR

a) Labelled diagram of a step up transformer

b) Calculation of number of turns in the secondary

Alternatively

[Note: Deduct $\frac{1}{2}$ mark, if labeling is not done]
a) When ac voltage is applied to primary coil the resulting current produces an alternating magnetic flux, which also links the secondary coil.

The induced emf, in the secondary coil, having \( N_s \) turns, is

\[
e_s = -N_s \frac{d\phi}{dt}
\]

This flux, also induces an emf, called back emf, in the primary coil.

\[
e_p = -N_p \frac{d\phi}{dt}
\]

But \( e_p = V_p \)

and \( e_s = V_s \)

\[
\Rightarrow \frac{V_s}{V_p} = \frac{N_s}{N_p}
\]

For an ideal transformer

\[
l_p V_p = i_s V_s
\]

\[
\Rightarrow \frac{V_s}{V_p} = \frac{i_p}{i_s}
\]

b) \( \frac{N_s}{N_p} = \frac{V_s}{V_p} \)

\[\begin{align*}
\frac{N_s}{3000} &= \frac{220}{2200} \\
\therefore N_s &= 300
\end{align*}\]

Q26

<table>
<thead>
<tr>
<th>Question</th>
<th>Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Distinction between unpolarised and linearly polarized light</td>
<td>2</td>
</tr>
<tr>
<td>Obtaining linearly polarized Light</td>
<td>1</td>
</tr>
<tr>
<td>b) Calculation of intensely of light</td>
<td>2</td>
</tr>
</tbody>
</table>

a) In an unpolarized light, the oscillations, of the electric field, are in random directions, in planes perpendicular to the direction of propagation. For a polarized light, the oscillations are aligned along one particular direction.

Alternatively

Polarized light can be distinguished, from unpolarized light, when it is allowed to pass through a polaroid. Polarized light does can show change in its intensity, on passing through a Polaroid; intensity remains same in case of unpolarized light.

When unpolarised light wave is incident on a polaroid, then the electric vectors along the direction of its aligned molecules, get absorbed; the electric vector, oscillating along a direction
perpendicular to the aligned molecules, pass through. This light is called linearly polarized light.

b) According to Malus’ Law:
\[ I = I_0 \cos^2 \theta \]
\[ \therefore I = \left( \frac{I_0}{2} \right) \cos^2 \theta, \text{ where } I_0 \text{ is the intensity of unpolarized light.} \]
\[ \theta = 60^\circ \text{ (given)} \]
\[ I = \frac{I_0}{2} \cos^2 60^\circ = \frac{I_0}{2} \times \left( \frac{1}{2} \right)^2 \]
\[ = \frac{I_0}{8} \]

OR

a) Explanation of two features (distinguishing between interference pattern and diffraction pattern.) 2
b) Calculation of angular width of central maxima 2
Estimation of number of fringes 1

<table>
<thead>
<tr>
<th>Interference Pattern</th>
<th>Diffraction pattern</th>
