Q. No. Value Points/Expected Answers

- $\rho=\frac{m}{n e^{2} \tau}$

1

- In case of conductors with increase in temperature, relaxation time decreases, so resistivity increases.
- In case of semiconductors with increase in temperature number density ( n ) of free electrons increases, hence resistivity increases.
- Deriving expression for e.m.f.
- Finding induced e.m.f. between the axel and rim of wheel 2

Flux linked with the coil at any instant of time is:
$\phi=\mathrm{NB} A \cos \omega t$
$\frac{d \phi}{d t}=N B A \omega(-\sin \omega t) \mathrm{S}$
$\varepsilon=-\frac{d \phi}{d t}$
$\varepsilon=\mathrm{NB} A \omega \sin \omega t$
$\varepsilon=\varepsilon_{0} \sin \omega t \quad\left(\right.$ Here $\left.\varepsilon_{0}=N B A \omega\right)$
(b) $l=0.5 \mathrm{~m}, v=120 \mathrm{rpm}=2 \mathrm{rps}$
$\omega=2 \pi \nu=4 \pi \mathrm{rad} / \mathrm{s}, \quad B=4 \times 10^{-4} T, \quad \delta=30^{0}$
$B_{H}=4 \times 10^{-4} \times \frac{\sqrt{3}}{2}$
$B_{H}=2 \sqrt{3} \times 10^{-4} T$
$\varepsilon=\frac{1}{2} B \omega l^{2}$
$\varepsilon=\frac{1}{2} \times 2 \sqrt{3} \times 10^{-4} \times 4 \pi \times(0.5)^{2}$
$\varepsilon=5.4 \times 10^{-4}$ volt
OR

- Deriving expression for magnetic energy stored in inductor and expression for energy density $11 / 2+1 / 2$
- Calculating the resultant magnetic force and torque $21 / 2+1 / 2$
(a) When external source supplies current to the inductor, e.m.f. is induced in it due to self induction. So the external supply has to do work to establish current. The amount of work done is:

$$
\begin{aligned}
& d w=|\varepsilon| I d t \quad \because \varepsilon=L \frac{d I}{d t} \\
& d w=L I d t
\end{aligned}
$$

Marks

Page 17 of 21
Marking Scheme
55/2/1
Q. No.
$W=\frac{1}{2} L I^{2}$
Energy density $=\frac{\text { Energy }}{\text { Volume }}$
$u=\left(1 / 2 L I^{2}\right) /$ volume
(b)

$$
5
$$

Force of attraction experienced by the length SP of the loop per unit length $F_{1}=\frac{2 \mu_{0} I_{1} I_{2}}{4 \pi r_{1}}$
$f_{1}=\frac{2 \times 10^{-7} \times 1 \times 0.2}{10 \times 10^{-2}}=4 \times 10^{-7} \mathrm{Nm}^{-1}$
$f_{2}=\frac{2 \mu_{0} I_{1} I_{2}}{4 \pi r_{2}}$
$f_{2}=\frac{2 \times 10^{-7} \times 1 \times 0.2}{15 \times 10^{-2}}=2.6 \times 10^{-7} \mathrm{Nm}^{-1}$
Force is repulsive
So the net force experienced by the loop is (per unit length)
$f=\left(f_{1}-f_{2}\right)$
Total force experienced by the loop is:
$F=\left(f_{1}-f_{2}\right) l=\left(1.4 \times 10^{-7}\right) \times 5 \times 10^{-2}$
$F=7 \times 10^{-7} \mathrm{~N}$
Net force is attractive in nature
As the lines of action of forces coincide torque is zero.

- Diagram production of polarized light by scattering of sun light 1
- Explanation
- Calculation of intensity of light transmitted through $P_{1}, P_{2}$ and $P_{3}$ $1 / 2+1+11 / 2$

## Diagram:

Explanation: Charges accelerating parallel to the double arrows do not radiate energy towards the observer. The radiation scattered by the molecules therefore is polarised perpendicular to the plane of the figure.
ALTERNATIVELY: If the student writes " scattered light when viewed in a perpendicular direction is found to be polarised " (award one mark)

Intensity of light transmitted by $1^{\text {st }}$ Polaroid is, $I_{1}=\frac{I}{2}$
Intensity of light transmitted by $2^{\text {nd }}$ Polaroid is,
$I_{2}=I_{1} \cos ^{2} 45^{\circ}=\frac{I}{2}\left(\frac{1}{\sqrt{2}}\right)^{2}=\frac{I}{4}$
Intensity of light transmitted by $3^{\text {rd }}$ Polaroid is,
$I_{3}=I_{2} \cos ^{2} 45^{\circ}=\frac{I}{2}\left(\frac{1}{\sqrt{2}}\right)^{2}=\frac{I}{8}$

## OR

- Reason $1 / 2$
- Deriving the expression for resultant intensity and condition for constructive and destructive interference

$$
1 \frac{1}{2}+1 / 2+1 / 2
$$

- Calculating the separation 2
(a) Because two independent sources cannot be coherent OR they are not coherent
(b) $y_{1}=a \cos \omega t$
$y_{2}=a \cos (\omega t+\phi)$

| So resultant displacement is give by <br> $y=y_{1}+y_{2}$ <br> $y=a \cos \omega t+a \cos (\omega t+\phi)$ <br> $y=2 a \cos (\phi / 2) \cos (\omega t+\phi / 2)$ <br> The amplitude of the resultant displacement is $2 a \cos (\phi / 2)$ and therefore <br> intensity at that point will be $I=4 I_{0} \cos ^{2}(\phi / 2)$ <br> For constructive interference: $\phi=0, \pm 2 \pi, \pm 4 \pi, \ldots \ldots .$. | 1 |
| :--- | :--- | :--- | :--- |

(b) The potentiometer is preferred over the voltmeter for measurement of e.m.f. of a cell because potentiometer draws no current from the voltage source being measured.
(c) $V=5 V, R_{A B}=50 \Omega, R=450 \Omega$

$$
\begin{aligned}
& \mathrm{I}=\frac{5}{450+50}=\frac{1}{100}=0.01 \mathrm{~A} \\
& V_{A B}=0.01 \times 50=0.5 \mathrm{~V} \\
& k=\frac{0.5}{10}=0.05 \mathrm{Vm}^{-1} \\
& l=\frac{V}{k}=\frac{300 \times 10^{-3}}{0.05}=6 \mathrm{~m}
\end{aligned}
$$

With 2V driver cell current in the circuit is $I=\frac{2}{450+50}=0.004 \mathrm{~A}$.
P.d. across $A B$ is $=0.004 \times 50=200 \mathrm{mV}$. Hence the circuit will not work.

## OR

- State the working principle of meter bridge
- Reasons $1 / 2+1 / 2$
- Calculation of potential difference using Kirchhoff's rules 3
(a) Meter bridge is based on the principle of balanced Wheatstone bridge.
(b) (i) Thick copper strips are used to minimize resistance of connections which are not accounted for in the bridge formula
(ii) Balance point is preferred near midpoint of bridge wire to minimize percentage error in resistance (R).
(c)
