Q7. Here, fof : $\mathrm{W} \rightarrow \mathrm{W}$ is such that, if n is odd, $\mathrm{fof}(\mathrm{n})=\mathrm{f}(\mathrm{f}(\mathrm{n}))=\mathrm{f}(\mathrm{n}-1)=\mathrm{n}-1+1=\mathrm{n}$
and if n is even, $\mathrm{fof}(\mathrm{n})=\mathrm{f}(\mathrm{f}(\mathrm{n}))=\mathrm{f}(\mathrm{n}+1)=\mathrm{n}+1-1=\mathrm{n}$

Hence, fof $=I$ This implies that $f$ is invertible and $f^{-1}=f$

OR

Let $(a, b) \in N \times N$. Then $\because a^{2}+b^{2}=b^{2}+a^{2} \therefore(a, b) R(a, b)$ Hence, $R$ is reflexive.

Let $(a, b),(c, d) \in N \times N$ be such that $(a, b) R(c, d)$
$\Rightarrow \mathrm{a}^{2}+\mathrm{d}^{2}=\mathrm{b}^{2}+\mathrm{c}^{2}$
$\Rightarrow \mathrm{c}^{2}+\mathrm{b}^{2}=\mathrm{d}^{2}+\mathrm{a}^{2}$
$\Rightarrow(\mathrm{c}, \mathrm{d}) \mathrm{R}(\mathrm{a}, \mathrm{b})$

Hence, R is symmetric.

Let $(a, b),(c, d),(e, f) \in N \times N$ be such that $(a, b) R(c, d),(c, d) R(e, f)$.
$\Rightarrow \mathrm{a}^{2}+\mathrm{d}^{2}=\mathrm{b}^{2}+\mathrm{c}^{2}$ and $\mathrm{c}^{2}+\mathrm{f}^{2}=\mathrm{d}^{2}+\mathrm{e}^{2}$
$\Rightarrow a^{2}+d^{2}+c^{2}+f^{2}=b^{2}+c^{2}+d^{2}+e^{2}$
$\Rightarrow \mathrm{a}^{2}+\mathrm{f}^{2}=\mathrm{b}^{2}+\mathrm{e}^{2}$
$\Rightarrow(\mathrm{a}, \mathrm{b}) \mathrm{R}(\mathrm{e}, \mathrm{f})$

Hence, R is transitive.

Since $R$ is reflexive, symmetric and transitive. Therefore $R$ is an equivalence relation. (1/2)

| $(1, \infty)$ | (+ve)(+ve)(+ve)= +ve | f is strictly increasing in $[1, \infty)$ |

Hence, $f$ is strictly increasing in $(-\infty,-2]$ and $\left[-\frac{4}{5}, \infty\right) . \mathrm{f}$ is strictly decreasing in $\left[-2,-\frac{4}{5}\right]$

Q23. The equation of the line passing through the point $(3,-2,1)$ and parallel to the given line is
$\frac{x-3}{2}=\frac{y+2}{-3}=\frac{z-1}{1}$

Any point on this line is $(2 \lambda+3,-3 \lambda-2, \lambda+1)$

If it lies on the plane, we have $3(2 \lambda+3)-3 \lambda-2-\lambda-1+2=0 \Rightarrow \lambda=-4$

Hence, the point common to the plane and the line is $(-5,10,-3)$.

Hence, the required distance $=\sqrt{(3+5)^{2}+(-2-10)^{2}+(1+3)^{2}}$ units $=4 \sqrt{14}$ units

The equation of the line passing through $(3,-2,1)$ and perpendicular to the plane is
$\frac{x-3}{3}=\frac{y+2}{1}=\frac{z-1}{-1}$

Any point on it is $(3 \mu+3, \mu-2,-\mu+1)$

If it lies on the plane, we get $3(3 \mu+3)+\mu-2+\mu-1+2=0 \Rightarrow \mu=\frac{-8}{7}$

The required foot of the perpendicular $=\left(\frac{-3}{7}, \frac{-22}{7}, \frac{15}{7}\right)$

Any plane through the line of intersection of the given planes is
$\overrightarrow{\mathrm{r}} \cdot(2 \hat{\mathrm{i}}+3 \hat{\mathrm{j}}-\hat{\mathrm{k}})+1+\lambda(\overrightarrow{\mathrm{r}} \cdot(\hat{\mathrm{i}}+\hat{\mathrm{j}}-2 \hat{\mathrm{k}}))=0$
or, $\overrightarrow{\mathrm{r}} .((2+\lambda) \hat{i}+(3+\lambda) \hat{j}+(-1-2 \lambda) \hat{k})=-1$

If it contains the point $(3,-2,-1)$, we have
(3) $(2+\lambda)+(-2)(3+\lambda)+(-1)(-1-2 \lambda)=-1 \Rightarrow \lambda=\frac{-2}{3}$

The required equation of the plane is
$\overrightarrow{\mathrm{r}} .\left(\left(2-\frac{2}{3}\right) \hat{\mathrm{i}}+\left(3-\frac{2}{3}\right) \hat{\mathrm{j}}+\left(-1+\frac{4}{3}\right) \hat{\mathrm{k}}\right)=-\operatorname{lor}, \overrightarrow{\mathrm{r}} .(4 \hat{\mathrm{i}}+7 \hat{\mathrm{j}}+\hat{\mathrm{k}})=-3$

If $\theta$ be the angle between the normals to the two given planes, then $\theta$ is the angle between the planes and $\cos \theta=\frac{\overrightarrow{\mathrm{n}}_{1} \cdot \overrightarrow{\mathrm{n}}_{2}}{\left|\overrightarrow{\mathrm{n}}_{1}\right|\left|\overrightarrow{\mathrm{n}}_{2}\right|}=\frac{2+3+2}{\sqrt{14} \sqrt{6}}=\frac{7}{2 \sqrt{21}}$

Q25. Let the radius of the circular garden be r m and the side of the square garden be x m . Then
$600=2 \pi r+4 x \Rightarrow x=\frac{600-2 \pi r}{4}$

The sum of the areas $=A=\pi r^{2}+x^{2} \Rightarrow A=\pi r^{2}+\left(\frac{600-2 \pi r}{4}\right)^{2}$
$\frac{\mathrm{dA}}{\mathrm{dr}}=2 \pi \mathrm{r}+\frac{2}{16}(600-2 \pi \mathrm{r})(-2 \pi)=\frac{\pi}{2}(4 \mathrm{r}-300+\pi \mathrm{r}), \frac{\mathrm{dA}}{\mathrm{dr}}=0 \Rightarrow \mathrm{r}=\frac{300}{\pi+4}$
$\frac{\mathrm{d}^{2} \mathrm{~A}}{\mathrm{dr}^{2}}=\frac{\pi}{2}(4+\pi),\left(\frac{\mathrm{d}^{2} \mathrm{~A}}{\mathrm{dr}^{2}}\right)_{\mathrm{r}=\frac{300}{\pi+4}}>0$

Therefore, $A$ is minimum when $r=\frac{300}{\pi+4}$ For this value of $r, x=2 r$

To achieve any goal, there is every possibility that energy, time and money are required to be invested. One must plan in such a manner that least energy, time and money are spent. A good planning and execution, therefore, is essentially required.

Q26. Let the number of pieces of model A to be manufactured be $=x$ and the number of pieces of model $B$ to be manufactured be $=y$.

Then to maximize the profit, $P=\operatorname{Rs}(8000 x+12000 y)$
subject to the constraints $9 x+12 y \leq 180$, or, $3 x+4 y \leq 60, x+3 y \leq 30, x \geq 0, y \geq 0$

Graph work (on the actual graph paper) ( $1+1 / 2$ )

| $(20,0)$ | Rs 160000 |
| $(12,6)$ | Rs 168000 (maximum) |
