

## EXERCISE 10.1

PAGE: 196

**1. Draw a line, say AB, take a point C outside it. Through C, draw a line parallel to AB using ruler and compasses only.**

**Solution:-**

Steps for construction,

1. Draw a line AB.
2. Take any point Q on AB and a point P outside AB and join PQ.
3. With Q as center and any radius draw an arc to cut AB at E and PQ at F.
4. With P as center and same radius draw an arc IJ to cut QP at G.
5. Place the pointed tip of the compass at E and adjust the opening so that the pencil tip is at F.
6. With the same opening as in step 5 and with G as center, draw an arc cutting the arc IJ at H.
7. Now, join PH to draw a line CD.

**2. Draw a line L. Draw a perpendicular to L at any point on L. On this perpendicular choose a point X, 4 cm away from I. Through X, draw a line m parallel to L.**

**Solution:-**

Steps for construction,

1. Draw a line L.
2. Take any point P on line L.
3. At point P, draw a perpendicular line N.
4. Place the pointed tip of the compass at P and adjust the compass up to length of 4 cm, draw an arc to cut this perpendicular at point X.
5. At point X, again draw a perpendicular line M.

**3. Let L be a line and P be a point not on L. Through P, draw a line m parallel to L. Now join P to any point Q on L. Choose any other point R on m. Through R, draw a line parallel to PQ. Let this meet L at S. What shape do the two sets of parallel lines enclose?**

**Solution:-**

Steps for construction,

1. Draw a line L.
2. Take any point Q on L and a point P outside L and join PQ.

3. Make sure that angles at point P and point Q are equal i.e.  $\angle Q = \angle P$
4. At point P extend line to get line M which is parallel L.
5. Then take any point R on line M.
6. At point R draw angle such that  $\angle P = \angle R$
7. At point R extend line which intersects line L at S and draw a line RS.

## EXERCISE 10.2

PAGE: 199

1. Construct  $\triangle XYZ$  in which  $XY = 4.5$  cm,  $YZ = 5$  cm and  $ZX = 6$  cm

Solution:-

Steps of construction:

1. Draw a line segment  $YZ = 5$  cm.
2. With Z as a center and radius 6 cm, draw an arc.
3. With Y as a center and radius 4.5 cm, draw another arc, cutting the previous arc at X.
4. Join XY and XZ.

Then,  $\triangle XYZ$  is the required triangle.

2. Construct an equilateral triangle of side 5.5 cm.

Solution:-

Steps of construction:

1. Draw a line segment  $AB = 5.5$  cm.
2. With A as a center and radius 5.5 cm, draw an arc.
3. With B as a center and radius 5.5 cm, draw another arc, cutting the previous arc at C.
4. Join CA and CB.

Then,  $\triangle ABC$  is the required equilateral triangle.

**3. Draw  $\triangle PQR$  with  $PQ = 4$  cm,  $QR = 3.5$  cm and  $PR = 4$  cm. What type of triangle is this?**

**Solution:-**

Steps of construction:

1. Draw a line segment  $QR = 3.5$  cm.
2. With Q as a center and radius 4 cm, draw an arc.
3. With R as a center and radius 4 cm, draw another arc, cutting the previous arc at P.
4. Join PQ and PR.

Then,  $\triangle PQR$  is the required isosceles triangle.

**4. Construct  $\triangle ABC$  such that  $AB = 2.5$  cm,  $BC = 6$  cm and  $AC = 6.5$  cm. Measure  $\angle B$ .**

**Solution:-**

1. Draw a line segment  $BC = 6$  cm.
2. With B as a center and radius 2.5 cm, draw an arc.
3. With C as a center and radius 6.5 cm, draw another arc, cutting the previous arc at A.
4. Join AB and AC.

Then,  $\triangle ABC$  is the required triangle.

5. When we will measure the angle B of triangle by protractor, then angle is equal to  $\angle B = 80^\circ$

### EXERCISE 10.3

PAGE: 200

1. Construct  $\triangle DEF$  such that  $DE = 5$  cm,  $DF = 3$  cm and  $m\angle EDF = 90^\circ$ .

Solution:-

Steps of construction:

1. Draw a line segment  $DF = 3$  cm.
2. At point D, draw a ray DX to making an angle of  $90^\circ$  i.e.  $\angle XDF = 90^\circ$ .
3. Along DX, set off  $DE = 5$  cm.
4. Join EF.

Then,  $\triangle EDF$  is the required right angled triangle.

2. Construct an isosceles triangle in which the lengths of each of its equal sides is 6.5 cm and the angle between them is  $110^\circ$ .

Solution:-

Steps of construction:

1. Draw a line segment  $AB = 6.5$  cm.
2. At point A, draw a ray AX to making an angle of  $110^\circ$  i.e.  $\angle XAB = 110^\circ$ .
3. Along AX, set off  $AC = 6.5$ cm.
4. Join CB.

Then,  $\triangle ABC$  is the required isosceles triangle.

**3. Construct  $\triangle ABC$  with  $BC = 7.5$  cm,  $AC = 5$  cm and  $m\angle C = 60^\circ$ .**

**Solution:-**

Steps of construction:

1. Draw a line segment  $BC = 7.5$  cm.
2. At point C, draw a ray CX to making an angle of  $60^\circ$  i.e.  $\angle XCB = 60^\circ$ .
3. Along CX, set off  $AC = 5$ cm.
4. Join AB.

Then,  $\triangle ABC$  is the required triangle.

## EXERCISE 10.4

PAGE: 202

1. Construct  $\triangle ABC$ , given  $m\angle A = 60^\circ$ ,  $m\angle B = 30^\circ$  and  $AB = 5.8$  cm.

Solution:-

Steps of construction:

1. Draw a line segment  $AB = 5.8$  cm.
2. At point A, draw a ray P to making an angle of  $60^\circ$  i.e.  $\angle PAB = 60^\circ$ .
3. At point B, draw a ray Q to making an angle of  $30^\circ$  i.e.  $\angle QBA = 30^\circ$ .
4. Now the two rays AP and BQ intersect at the point C.

Then,  $\triangle ABC$  is the required triangle.

2. Construct  $\triangle PQR$  if  $PQ = 5$  cm,  $m\angle PQR = 105^\circ$  and  $m\angle QRP = 40^\circ$ .

(Hint: Recall angle-sum property of a triangle).

Solution:-

We know that the sum of the angles of a triangle is  $180^\circ$ .

$$\begin{aligned}\therefore \angle PQR + \angle QRP + \angle RPQ &= 180^\circ \\ &= 105^\circ + 40^\circ + \angle RPQ = 180^\circ \\ &= 145^\circ + \angle RPQ = 180^\circ \\ &= \angle RPQ = 180^\circ - 145^\circ \\ &= \angle RPQ = 35^\circ\end{aligned}$$

Hence, the measures of  $\angle RPQ$  is  $35^\circ$ .

Steps of construction:

1. Draw a line segment  $PQ = 5$  cm.
2. At point P, draw a ray L to making an angle of  $105^\circ$  i.e.  $\angle LPQ = 105^\circ$ .
3. At point Q, draw a ray M to making an angle of  $40^\circ$  i.e.  $\angle MQP = 40^\circ$ .
4. Now the two rays PL and QM intersect at the point R.

Then,  $\Delta PQR$  is the required triangle.

**3. Examine whether you can construct  $\Delta DEF$  such that  $EF = 7.2$  cm,  $m\angle E = 110^\circ$  and  $m\angle F = 80^\circ$ . Justify your answer.**

**Solution:-**

From the question it is given that,

$$EF = 7.2 \text{ cm}$$

$$\angle E = 110^\circ$$

$$\angle F = 80^\circ$$

Now we have to check whether it is possible to construct  $\triangle DEF$  from the given values. We know that the sum of the angles of a triangle is  $180^\circ$ .

Then,

$$\angle D + \angle E + \angle F = 180^\circ$$

$$\angle D + 110^\circ + 80^\circ = 180^\circ$$

$$\angle D + 190^\circ = 180^\circ$$

$$\angle D = 180^\circ - 190^\circ$$

$$\angle D = -10^\circ$$

We may observe that the sum of two angles is  $190^\circ$  is greater than  $180^\circ$ . So, it is not possible to construct a triangle.

## EXERCISE 10.5

PAGE: 203

1. Construct the right angled  $\Delta PQR$ , where  $m\angle Q = 90^\circ$ ,  $QR = 8\text{ cm}$  and  $PR = 10\text{ cm}$ .

**Solution:-**

Steps of construction:

1. Draw a line segment  $QR = 8\text{ cm}$ .
2. At point Q, draw a ray QY to making an angle of  $90^\circ$  i.e.  $\angle YQR = 90^\circ$ .
3. With R as a center and radius  $10\text{ cm}$ , draw an arc that cuts the ray QY at P.
4. Join PR.

Then,  $\Delta PQR$  is the required right angled triangle.

2. Construct a right-angled triangle whose hypotenuse is  $6\text{ cm}$  long and one of the legs is  $4\text{ cm}$  long

**Solution:-**

Let us consider  $\Delta ABC$  is a right angled triangle at  $\angle B = 90^\circ$

Then,

$AC$  is hypotenuse =  $6\text{ cm}$

... [given in the question]

$BC = 4\text{ cm}$

Now, we have to construct the right angled triangle by the above values

Steps of construction:

1. Draw a line segment  $BC = 4$  cm.
2. At point B, draw a ray BX to making an angle of  $90^\circ$  i.e.  $\angle XBC = 90^\circ$ .
3. With C as a center and radius 6 cm, draw an arc that cuts the ray BX at A.
4. Join AC.

Then,  $\triangle ABC$  is the required right angled triangle.

**3. Construct an isosceles right-angled triangle ABC, where  $m\angle ACB = 90^\circ$  and  $AC = 6$  cm.**

**Solution:-**

Steps of construction:

1. Draw a line segment  $BC = 6$  cm.
2. At point C, draw a ray CX to making an angle of  $90^\circ$  i.e.  $\angle XCB = 90^\circ$ .
3. With C as a center and radius 6 cm, draw an arc that cuts the ray CX at A.

4. Join AB.

Then,  $\triangle ABC$  is the required right angled triangle.
