

EXERCISE 14.1

PAGE NO: 14.4

1. Find the compound interest when principal = Rs 3000, rate = 5% per annum and time = 2 years. Solution: Given details are, Principal (p) = Rs 3000 Rate (r) = 5% Time = 2years Interest for the first year = $(3000 \times 5 \times 1)/100 = 150$ Amount at the end of first year = Rs 3000 + 300 = Rs 3150Principal interest for the second year = $(3150 \times 5 \times 1)/100 = 157.5$ Amount at the end of second year = Rs 3150 + 157.5 = Rs 3307.5 \therefore Compound Interest = Rs 3307.5 - Rs 3000 = Rs 307.5

2. What will be the compound interest on Rs. 4000 in two years when rate of interest is 5% per annum?

Solution:

Given details are, Principal (p) = Rs 4000 Rate (r) = 5% Time = 2years By using the formula, $A = P (1 + R/100)^n$ = 4000 (1 + 5/100)² = 4000 (105/100)² = Rs 4410 \therefore Compound Interest = A - P = Rs 4410 - Rs 4000 = Rs 410

3. Rohit deposited Rs. 8000 with a finance company for 3 years at an interest of 15% per annum. What is the compound interest that Rohit gets after 3 years? Solution:

Given details are, Principal (p) = Rs 8000 Rate (r) = 15% Time = 3years By using the formula, $A = P (1 + R/100)^n$ $= 8000 (1 + 5/100)^3$

 $= 8000 (115/100)^3$

 $\therefore \text{ Compound Interest} = A - P = Rs \ 12167 - Rs \ 8000 = Rs \ 4167$

4. Find the compound interest on Rs. 1000 at the rate of 8% per annum for 1 $^{1\!/_2}$ years when interest is compounded half yearly.

Solution:

Given details are, Principal (p) = Rs 1000 Rate (r) = 8% Time = 1 ¹/₂ years = $3/2 \times 2 = 3$ half years By using the formula, A = P (1 + R/100)ⁿ = 1000 (1 + 8/100)³ = 1000 (208/100)³ = Rs 1124.86 \therefore Compound Interest = A - P = Rs 1124.86 - Rs 1000 = Rs 124.86

5. Find the compound interest on Rs. 160000 for one year at the rate of 20% per annum, if the interest is compounded quarterly. Solution:

Given details are, Principal (p) = Rs 160000 Rate (r) = 20% = 20/4 = 5% (for quarter year) Time = 1year = $1 \times 4 = 4$ quarters By using the formula, $A = P (1 + R/100)^n$ = 160000 (1 + 5/100)⁴ = 160000 (105/100)⁴ = Rs 194481 \therefore Compound Interest = A – P = Rs 194481 – Rs 160000 = Rs 34481

6. Swati took a loan of Rs. 16000 against her insurance policy at the rate of $12\frac{1}{2}$ % per annum. Calculate the total compound interest payable by Swati after 3 years. Solution:

Given details are, Principal (p) = Rs 16000 Rate (r) = $12\frac{1}{2}\% = 12.5\%$ Time = 3years

By using the formula,

- $A = P (1 + R/100)^n$
 - $= 16000 (1 + 12.5/100)^3$
 - $= 16000 (112.5/100)^3$
 - = Rs 22781.25
- : Compound Interest = A P = Rs 22781.25 Rs 16000 = Rs 6781.25

7. Roma borrowed Rs. 64000 from a bank for 1 ½ years at the rate of 10% per annum. Compare the total compound interest payable by Roma after 1 ½ years, if the interest is compounded half-yearly.

Solution:

Given details are, Principal (p) = Rs 64000 Rate (r) = 10 % = 10/2 % (for half a year) Time = 1 $\frac{1}{2}$ years = $3/2 \times 2 = 3$ (half year) By using the formula, A = P (1 + R/100)ⁿ = 64000 (1 + 10/2×100)³ = 64000 (210/200)³ = Rs 74088 \therefore Compound Interest = A – P = Rs 74088 – Rs 64000 = Rs 10088

8. Mewa lal borrowed Rs. 20000 from his friend Rooplal at 18% per annum simple interest. He lent it to Rampal at the same rate but compounded annually. Find his gain after 2 years.

Solution:

Given details are, Principal (p) = Rs 20000 Rate (r) = 18 % Time = 2 years By using the formula, Interest amount Mewa lal has to pay, By using the formula, Simple interest = $P \times T \times R/100$ = $(20000 \times 18 \times 2)/100 = 7200$

Interest amount Rampal has to pay to Mewa lal, By using the formula, $A = P (1 + R/100)^n$

- $= 20000 (1 + 18/100)^2$
- $= 20000 (118/100)^2$
- = Rs 27848 20000 (principal amount)
- = Rs 7848
- ∴ Mewa lal gain = Rs (7848 7200) = Rs 648

9. Find the compound interest on Rs. 8000 for 9 months at 20% per annum compounded quarterly.

Solution:

Given details are, Principal (p) = Rs 8000 Rate (r) = 20 % = 20/4 = 5% (for quarterly) Time = 9 months = 9/3 = 3 (for quarter year) By using the formula, $A = P (1 + R/100)^n$ = 8000 (1 + 5/100)³ = 8000 (105/100)³ = Rs 9261 \therefore Compound Interest = A - P = Rs 9261 - Rs 8000 = Rs 1261

10. Find the compound interest at the rate of 10% per annum for two years on that principal which in two years at the rate of 10% per annum given Rs. 200 as simple interest.

Solution:

Given details are, Simple interest (SI) = Rs 200 Rate (r) = 10 % Time = 2 years So, by using the formula, Simple interest = $P \times T \times R/100$ $P = (SI \times 100)/T \times R$ $= (200 \times 100)/2 \times 10$ = 20000/20

 $= Rs \ 1000$

Now,

Rate of compound interest = 10% Time = 2years

By using the formula, $A = P (1 + R/100)^n$ = 1000 (1 + 10/100)² = 1000 (110/100)² = Rs 1210 ∴ Compound Interest = A – P = Rs 1210 – Rs 1000 = Rs 210

11. Find the compound interest on Rs. 64000 for 1 year at the rate of 10% per annum compounded quarterly.

Solution:

Given details are, Principal (p) = Rs 64000 Rate (r) = 10 % = 10/4 % (for quarterly) Time = 1year = $1 \times 4 = 4$ (for quarter in a year) By using the formula, $A = P (1 + R/100)^n$ = 64000 (1 + 10/4×100)⁴ = 64000 (410/400)⁴ = Rs 70644.03 \therefore Compound Interest = A – P = Rs 70644.03 – Rs 64000 = Rs 6644.03

12. Ramesh deposited Rs. 7500 in a bank which pays him 12% interest per annum compounded quarterly. What is the amount which he receives after 9 months. Solution:

Given details are, Principal (p) = Rs 7500 Rate (r) = 12 % = 12/4 = 3 % (for quarterly) Time = 9 months = 9/12 years = $9/12 \times 4 = 3$ (for quarter in a year) By using the formula, A = P (1 + R/100)ⁿ = 7500 (1 + 3/100)³ = 7500 (103/100)³ = Rs 8195.45 \therefore Required amount is Rs 8195.45

13. Anil borrowed a sum of Rs. 9600 to install a hand pump in his dairy. If the rate of interest is $5\frac{1}{2}$ % per annum compounded annually, determine the compound interest which Anil will have to pay after 3 years. Solution:

Given details are, Principal (p) = Rs 9600 Rate (r) = $5\frac{1}{2}\% = 11/2\%$ Time = 3years By using the formula, $A = P (1 + R/100)^n$ = 9600 $(1 + 11/2 \times 100)^3$ = 9600 $(211/200)^3$ = Rs 11272.71 \therefore Compound Interest = A – P = Rs 11272.71 – Rs 9600 = Rs 1672.71

14. Surabhi borrowed a sum of Rs. 12000 from a finance company to purchase a refrigerator. If the rate of interest is 5% per annum compounded annually, calculate the compound interest that Surabhi has to pay to the company after 3 years.

Solution:

Given details are, Principal (p) = Rs 12000 Rate (r) = 5 % Time = 3years By using the formula, $A = P (1 + R/100)^n$ = 12000 (1 + 5/100)³ = 12000 (105/100)³ = Rs 13891.5 \therefore Compound Interest = A – P = Rs 13891.5 – Rs 12000 = Rs 1891.5

15. Daljit received a sum of Rs. 40000 as a loan from a finance company. If the rate of interest is 7% per annum compounded annually, calculate the compound interest that Daljit pays after 2 years.

Solution:

Given details are, Principal (p) = Rs 40000 Rate (r) = 7% Time = 2years By using the formula, $A = P (1 + R/100)^n$ = 40000 (1 + 7/100)² = 40000 (107/100)²

= Rs 45796 \therefore Compound Interest = A - P = Rs 45796 - Rs 40000 = Rs 5796

EXERCISE 14.2

PAGE NO: 14.14

1. Compute the amount and the compound interest in each of the following by using the formulae when : (i) Principal = Rs 3000, Rate = 5%, Time = 2 years (ii) Principal = Rs 3000, Rate = 18%, Time = 2 years (iii) Principal = Rs 5000, Rate = 10 paise per rupee per annum, Time = 2 years (iv) Principal = Rs 2000, Rate = 4 paise per rupee per annum, Time = 3 years (v) Principal = Rs 12800, Rate = $7 \frac{1}{2}$ %, Time = 3 years (vi) Principal = Rs 10000, Rate = 20% per annum compounded half-yearly, Time = 2 years (vii) Principal = Rs 160000, Rate = 10 paise per rupee per annum compounded half vearly, Time = 2 years. Solution: By using the formula, $A = P (1 + R/100)^{n}$ Let us solve (i) Given, P = Rs 3000, rate = 5%, time = 2years $A = P (1 + R/100)^{n}$ $= 3000 (1 + 5/100)^2$ $= 3000 (105/100)^2$ = Rs 3307.5Compound interest (CI) = A-P = Rs 3307.5 - 3000 = Rs 307.5(ii) Given, P = Rs 3000, rate = 18%, time = 2years $A = P (1 + R/100)^{n}$ $= 3000 (1 + 18/100)^{2}$ $= 3000 (118/100)^{2}$ = Rs 4177.2Compound interest (CI) = A-P = Rs 4177.2 - 3000 = Rs 1177.2(iii) Given, P = Rs 5000, rate = 10%, time = 2years $A = P (1 + R/100)^{n}$ $= 5000 (1 + 10/100)^2$ $= 5000 (110/100)^2$ $= Rs \ 6050$ Compound interest (CI) = A-P = Rs 6050 - 5000 = Rs 1050(iv) Given, P = Rs 2000, rate = 4%, time = 3 years

 $A = P (1 + R/100)^{n}$ $= 2000 (1 + 4/100)^3$ $= 2000 (104/100)^3$ = Rs 2249.72Compound interest (CI) = A-P = Rs 2249.72 - 2000 = Rs 249.72(v) Given, $P = Rs \ 12800$, rate = 7 $\frac{1}{2}$ % = 15/2% = 7.5%, time = 3 years $A = P (1 + R/100)^{n}$ $= 12800 (1 + 7.5/100)^3$ $= 12800 (107.5/100)^{3}$ = Rs 15901.4Compound interest (CI) = A-P = Rs 15901.4 - 12800 = Rs 3101.4(vi) Given, P = Rs 10000, rate = 20 % = 20/2 = 10% (quarterly), time = $2years = 2 \times 2 = 10\%$ 4years $A = P (1 + R/100)^{n}$ $= 10000 (1 + 10/100)^4$ $= 10000 (110/100)^4$ = Rs 14641Compound interest (CI) = $A-P = Rs \ 14641 - 10000 = Rs \ 4641$ (vii) Given, P = Rs 160000, rate = 10% = 10/2% = 5% (half yearly), time = 2years = 2×2 = 4 quarters $A = P (1 + R/100)^{n}$ $= 160000 (1 + 5/100)^4$ $= 160000 (105/100)^4$ = Rs 194481 Compound interest (CI) = $A-P = Rs \ 194481 - 160000 = Rs \ 34481$

2. Find the amount of Rs. 2400 after 3 years, when the interest is compounded annually at the rate of 20% per annum. Solution:

Given details are, Principal (p) = Rs 2400 Rate (r) = 20% per annum Time (t) = 3 years By using the formula, $A = P (1 + R/100)^n$ = 2400 $(1 + 20/100)^3$

 $= 2400 (120/100)^3$ = Rs 4147.2

 \therefore Amount is Rs 4147.2

3. Rahman lent Rs. 16000 to Rasheed at the rate of 12 ½ % per annum compound interest. Find the amount payable by Rasheed to Rahman after 3 years. Solution:

Given details are, Principal (p) = Rs 16000 Rate (r) = $12 \frac{1}{2} \%$ per annum = 12.5%Time (t) = 3 years By using the formula, A = P (1 + R/100)ⁿ = $16000 (1 + 12.5/100)^3$ = $16000 (112.5/100)^3$ = Rs 22781.25 \therefore Amount is Rs 22781.25

4. Meera borrowed a sum of Rs. 1000 from Sita for two years. If the rate of interest is 10% compounded annually, find the amount that Meera has to pay back. Solution:

Given details are, Principal (p) = Rs 1000 Rate (r) = 10 % per annum Time (t) = 2 years By using the formula, $A = P (1 + R/100)^n$ = 1000 (1 + 10/100)² = 1000 (110/100)² = Rs 1210

∴ Amount is Rs 1210

5. Find the difference between the compound interest and simple interest. On a sum of Rs. 50,000 at 10% per annum for 2 years. Solution:

Given details are, Principal (p) = Rs 50000 Rate (r) = 10 % per annum Time (t) = 2 years

By using the formula, $A = P (1 + R/100)^n$ $= 50000 (1 + 10/100)^2$ $= 50000 (110/100)^2$ = Rs 60500 CI = Rs 60500 - 50000 = Rs 10500We know that $SI = (PTR)/100 = (50000 \times 10 \times 2)/100 = Rs 10000$ \therefore Difference amount between CI and SI = 10500 - 10000 = Rs 500

6. Amit borrowed Rs. 16000 at 17 ½ % per annum simple interest. On the same day, he lent it to Ashu at the same rate but compounded annually. What does he gain at the end of 2 years?

Solution:

Given details are, Principal (p) = Rs 16000 Rate (r) = 17 $\frac{1}{2}$ % per annum = 35/2% or 17.5% Time (t) = 2 years Interest paid by Amit = (PTR)/100 = (16000×17.5×2)/100 = Rs 5600 Amount gained by Amit: By using the formula, A = P (1 + R/100)ⁿ = 16000 (1 + 17.5/100)² = Rs 22090 CI = Rs 22090 - 16000 = Rs 6090 \therefore Amit total gain is = Rs 6090 - 5600 = Rs 490

7. Find the amount of Rs. 4096 for 18 months at 12 ½ % per annum, the interest being compounded semi-annually. Solution:

Given details are, Principal (p) = Rs 4096 Rate (r) = $12\frac{1}{2}$ % per annum = 25/4% or 12.5/2% Time (t) = 18 months = $(18/12) \times 2 = 3$ half years By using the formula, A = P (1 + R/100)ⁿ = $4096 (1 + 12.5/2 \times 100)^3$ = $4096 (212.5/200)^3$ = Rs 4913

: Amount is Rs 4913

8. Find the amount and the compound interest on Rs. 8000 for 1 $^{1\!/_2}$ years at 10% per annum, compounded half-yearly.

Solution:

Given details are, Principal (p) = Rs 8000 Rate (r) = 10 % per annum = 10/2% = 5% (half yearly) Time (t) = 1 ½ years = $(3/2) \times 2 = 3$ half years By using the formula, A = P (1 + R/100)ⁿ = $8000 (1 + 5/100)^3$ = $8000 (105/100)^3$ = Rs 9261 \therefore CI = Rs 9261 - 8000 = Rs 1261

9. Kamal borrowed Rs. 57600 from LIC against her policy at 12 ½ % per annum to build a house. Find the amount that she pays to the LIC after 1 ½ years if the interest is calculated half-yearly.

Solution:

Given details are, Principal (p) = Rs 57600 Rate (r) = $12\frac{1}{2}\%$ per annum = $25/2 \times 2\% = 25/4\% = 12.5/2\%$ (half yearly) Time (t) = $1\frac{1}{2}$ years = $(3/2) \times 2 = 3$ half years By using the formula, A = P (1 + R/100)ⁿ = 57600 (1 + $12.5/2 \times 100)^3$ = 57600 (212.5/200)³ = Rs 69089.06 \therefore Amount is Rs 69089.06

10. Abha purchased a house from Avas Parishad on credit. If the cost of the house is Rs. 64000 and the rate of interest is 5% per annum compounded half-yearly, find the interest paid by Abha after one year and a half. Solution:

Given details are, Principal (p) = Rs 64000 Rate (r) = 5 % per annum = 5/2% (half yearly) Time (t) = 1 ½ years = $(3/2) \times 2 = 3$ half years

By using the formula, $A = P (1 + R/100)^n$ $= 64000 (1 + 5/2 \times 100)^3$ $= 64000 (205/200)^3$ = Rs 68921 \therefore CI = Rs 68921 - 64000 = Rs 4921

11. Rakesh lent out Rs. 10000 for 2 years at 20% per annum, compounded annually. How much more he could earn if the interest be compounded half-yearly? Solution:

Given details are, Principal (p) = Rs 10000 Rate (r) = 20% per annum Time (t) = 2years By using the formula, $A = P (1 + R/100)^n$ = 10000 (1 + 20/100)² = 10000 (120/100)² = Rs 14400

When the interest is compounded half yearly, Rate = $20/2 \ \% = 10\%$ Time = 2×2 years = 4years By using the formula, $A = P (1 + R/100)^n$ = $10000 (1 + 10/100)^4$ = $10000 (110/100)^4$ = Rs 14641 \therefore Rakesh could earn Rs (14641 - 14400) = Rs 241 more

12. Romesh borrowed a sum of Rs. 245760 at 12.5% per annum, compounded annually. On the same day, he lent out his money to Ramu at the same rate of interest, but compounded semi-annually. Find his gain after 2 years. Solution:

Given details are, Principal (p) = Rs 245760 Rate (r) = 12.5% per annum Time (t) = 2years By using the formula,

 $A = P (1 + R/100)^{n}$ = 245760 (1 + 12.5/100)² = 245760 (112.5/100)² = Rs 311040

When compounded semi-annually, Rate = 12.5/2% = 6.25%Time = 2×2 years = 4years By using the formula, $A = P (1 + R/100)^n$ = $245760 (1 + 6.25/100)^4$ = $245760 (106.25/100)^4$ = Rs 313203.75 \therefore Romesh gain is Rs (313203.75 - 311040) = Rs 2163.75

13. Find the amount that David would receive if he invests Rs. 8192 for 18 months at $12\frac{1}{2}$ % per annum, the interest being compounded half-yearly.

Solution:

Given details are, Principal (p) = Rs 8192 Rate (r) = $12\frac{1}{2}$ % per annum = $25/2 \times 2 = 25/4$ % = 12.5/2% (half yearly) Time (t) = 18 months = $18/12 = 1\frac{1}{2}$ years = $(3/2) \times 2 = 3$ years By using the formula, A = P (1 + R/100)ⁿ = $8192 (1 + 12.5/2 \times 100)^3$ = $8192 (212.5/200)^3$ = Rs 9826 \therefore Amount is Rs 9826

14. Find the compound interest on Rs. 15625 for 9 months, at 16% per annum, compounded quarterly. Solution:

Given details are, Principal (p) = Rs 15625 Rate (r) = 16% per annum = 16/4 = 4% (quarterly) Time (t) = 9 months = 9/12 ×4 = 3quarters of a year By using the formula, $A = P (1 + R/100)^n$ = 15625 (1 + 4/100)³

= $15625 (104/100)^3$ = Rs 17576 \therefore CI = Rs 17576 - 15625 = Rs 1951

15. Rekha deposited Rs. 16000 in a foreign bank which pays interest at the rate of 20% per annum compounded quarterly, find the interest received by Rekha after one year

Solution:

Given details are, Principal (p) = Rs 16000 Rate (r) = 20% per annum = 20/4 = 5% (quarterly) Time (t) = 1 year = 4 quarters of a year By using the formula, $A = P (1 + R/100)^n$ = 16000 (1 + 5/100)⁴ = 16000 (105/100)⁴ = Rs 19448.1 \therefore CI = Rs 19448.1 - 16000 = Rs 3448.1

16. Find the amount of Rs. 12500 for 2 years compounded annually, the rate of interest being 15% for the first year and 16% for the second year. Solution:

Given details are, Principal (p) = Rs 12500 Rate₁ (r) = 15% and Rate₂ = 16% Time (t) = 2 years By using the formula, $A = P (1 + R_1/100 \times 1 + R_2/100)$ = 12500 (1 + 15/100 × 1 + 16/100) = 12500 (1.15 × 1.16) = Rs 16675

: Amount after two years is Rs 16675

17. Ramu borrowed Rs. 15625 from a finance company to buy scooter. If the rate of interest be 16% per annum compounded annually, what payment will he have to make after 2 ¹/₄ years?

Solution:

Given details are, Principal (p) = Rs 15625

Rate (r) = 16% Time (t) = 2 ¹/₄ years By using the formula, A = P (1 + R/100 × 1 + R/100) = 15625 (1 + 16/100)² × (1 + (16/4)/100) = 15625 (1 + 16/100)² × (1 + 4/100) = 15625 (1.16)² × (1.04) = Rs 21866

: Amount after 2 ¼ years is Rs 21866

18. What will Rs. 125000 amount to at the rate of 6%, if the interest is calculated after every four months?

Solution:

Given details are, Principal (p) = Rs 125000 Rate (r) = 6% per annum Time (t) = 1 year Since interest is compounded after 4months, interest will be counted as 6/3 = 2% and Time will be 12/4 = 3quarters By using the formula, $A = P (1 + R/100)^n$ $= 125000 (1 + 2/100)^3$ $= 125000 (102/100)^3$ = Rs 132651 \therefore Amount is Rs 132651

19. Find the compound interest at the rate of 5% for three years on that principal which in three years at the rate of 5% per annum gives Rs. 12000 as simple interest. Solution:

Given details are, Simple interest (SI) = Rs 12000 Rate (r) = 5% per annum Time (t) = 3 years SI = (PTR)/100 P = (SI×100) / (T×R) = (12000×100) / (3×5) = 1200000/15 = 80000

By using the formula,

```
A = P (1 + R/100)<sup>n</sup>
= 80000 (1 + 5/100)<sup>3</sup>
= 80000 (105/100)<sup>3</sup>
= Rs 92610
∴ CI = Rs 92610 - 80000 = Rs 12610
```

20. A sum of money was lent for 2 years at 20% compounded annually. If the interest is payable half-yearly instead of yearly, then the interest is Rs. 482 more. Find the sum.

Solution:

```
Given details are,

Rate (r) = 20% per annum = 20/2 = 10\% (half yearly)

Time (t) = 2 years = 2 \times 2 = 4 half years

Principal be = Rs P

P (1 + R/100)<sup>n</sup> - P (1 + R/100)<sup>n</sup> = 482

P (1 + 10/100)<sup>4</sup> - P (1 + 20/100)<sup>2</sup> = 482

P (110/100)<sup>4</sup> - P (120/100)<sup>2</sup> = 482

P (1.4641) - P (1.44) = 482

0.0241P = 482

P = 482/0.0241

= 20000

\therefore Amount is Rs 20000
```

21. Simple interest on a sum of money for 2 years at $6\frac{1}{2}$ % per annum is Rs. 5200. What will be the compound interest on the sum at the same rate for the same period?

Solution:

```
Given details are,

Rate = 6\frac{1}{2}\% per annum = 13/2\%

Simple Interest (SI) = Rs 5200

Time (t) = 2 years

By using the formula,

SI = (PTR)/100

P = (SI×100) / (T×R)

= (5200×100) / (2×13/2)

= (5200×100×2) / (2×13)

= 1040000/26

= Rs 40000

Now,
```

P = Rs 40000 R = 13/2% = 6.5%T = 2years By using the formula, A = P (1 + R/100)ⁿ = 40000 (1 + 6.5/100)² = 40000 (106.5/100)² = Rs 45369 ∴ CI = Rs 45369 - 40000 = Rs 5369

22. What will be the compound interest at the rate of 5% per annum for 3 years on that principal which in 3 years at the rate of 5% per annum gives Rs. 1200 as simple interest.

Solution:

```
Given details are,
Rate = 5\% per annum
Simple Interest (SI) = Rs \ 1200
Time (t) = 3 years
By using the formula,
SI = (PTR)/100
P = (SI \times 100) / (T \times R)
  = (1200 \times 100) / (3 \times 5)
  = 120000/15
  = Rs 8000
Now,
P = Rs 8000
R = 5\%
T = 3years
By using the formula,
A = P (1 + R/100)^{n}
  = 8000 (1 + 5/100)^3
  = 8000 (105/100)^3
  = Rs 9261
\therefore CI = Rs 9261 - 8000 = Rs 1261
```

EXERCISE 14.3

PAGE NO: 14.20

1. On what sum will the compound interest at 5% per annum for 2 years compounded annually be Rs 164? Solution: Given details are, Rate = 5% per annum Compound Interest (CI) = Rs 164 Time (t) = 2 years By using the formula, Let P be 'x' CI = A - P $164 = P (1 + R/100)^{n} - P$ $= P [(1 + R/100)^{n} - 1]$ $= x [(1 + 5/100)^2 - 1]$ $= x [(105/100)^2 - 1]$ $164 = x ((1.05)^2 - 1)$ $x = 164 / ((1.05)^2 - 1)$ = 164/0.1025 $= Rs \ 1600$ \therefore The required sum is Rs 1600

2. Find the principal if the interest compounded annually at the rate of 10% for two years is Rs. 210. Solution: Given details are, Rate = 10 % per annum Compound Interest (CI) = Ps 210

```
Compound Interest (CI) = Rs 210

Time (t) = 2 years

By using the formula,

Let P be 'x'

CI = A - P

210 = P (1 + R/100)<sup>n</sup> - P

= P [(1 + R/100)<sup>n</sup> - 1]

= x [(1 + 10/100)<sup>2</sup> - 1]

= x [(110/100)<sup>2</sup> - 1]

210 = x ((1.1)<sup>2</sup> - 1)

x = 210 / ((1.1)<sup>2</sup> - 1)

= 210/0.21
```

= Rs 1000 \therefore The required sum is Rs 1000

3. A sum amounts to Rs. 756.25 at 10% per annum in 2 years, compounded annually. Find the sum.

Solution:

Given details are, Rate = 10 % per annum Amount = Rs 756.25 Time (t) = 2 years By using the formula, $A = P (1 + R/100)^n$ 756.25 = P $(1 + 10/100)^2$ P = 756.25 / $(1 + 10/100)^2$ = 756.25/1.21 = 625

 \therefore The principal amount is Rs 625

4. What sum will amount to Rs. 4913 in 18 months, if the rate of interest is 12 ¹/₂ % per annum, compounded half-yearly? Solution:

Given details are, Rate = $12 \frac{1}{2}\%$ per annum = 25/2% = 25/2/2 = 25/4% half yearly Amount = Rs 4913 Time (t) = 18months = 18/12 years = $3/2 \times 2 = 3$ half years By using the formula, A = P (1 + R/100)ⁿ 4913 = P (1 + $25/4 \times 100)^3$ P = $4913 / (1 + <math>25/4 \times 100)^3$ = 4913/1.19946= 4096

: The principal amount is Rs 4096

5. The difference between the compound interest and simple interest on a certain sum at 15% per annum for 3 years is Rs. 283.50. Find the sum. Solution:

Given details are, Rate = 15 % per annum Compound Interest (CI) – Simple Interest (SI)= Rs 283.50

BYJU'S

RD Sharma Solutions for Class 8 Maths Chapter 14 – Compound Interest

Time (t) = 3 years By using the formula, CI - SI = 283.50P [(1 + R/100)ⁿ - 1] - (PTR)/100 = 283.50 P [(1 + 15/100)³ - 1] - (P(3)(15))/100 = 283.50 P[1.520 - 1] - (45P)/100 = 283.50 0.52P - 0.45P = 283.50 0.07P = 283.50 P = 283.50/0.07 = 4000 \therefore The sum is Rs 4000

6. Rachana borrowed a certain sum at the rate of 15% per annum. If she paid at the end of two years Rs. 1290 as interest compounded annually, find the sum she borrowed.

Solution:

Given details are, Rate = 15 % per annum Time = 2 years CI = Rs 1290 By using the formula, CI = P [$(1 + R/100)^n - 1$] 1290 = P [$(1 + 15/100)^2 - 1$] 1290 = P [0.3225] P = 1290/0.3225= 4000 \therefore The sum is Rs 4000

7. The interest on a sum of Rs. 2000 is being compounded annually at the rate of 4% per annum. Find the period for which the compound interest is Rs. 163.20. Solution:

Given details are, Rate = 4 % per annum CI = Rs 163.20 Principal (P) = Rs 2000 By using the formula, CI = P [$(1 + R/100)^n - 1$] 163.20 = 2000[$(1 + 4/100)^n - 1$] 163.20 = 2000 [$(1.04)^n - 1$]

$$\begin{split} &163.20 = 2000 \times (1.04)^n - 2000 \\ &163.20 + 2000 = 2000 \times (1.04)^n \\ &2163.2 = 2000 \times (1.04)^n \\ &(1.04)^n = 2163.2/2000 \\ &(1.04)^n = 1.0816 \\ &(1.04)^n = (1.04)^2 \\ &\text{So on comparing both the sides, n = 2} \\ &\therefore \text{ Time required is 2 years} \end{split}$$

8. In how much time would Rs. 5000 amount to Rs. 6655 at 10% per annum compound interest?

Solution:

Given details are, Rate = 10% per annum A = Rs 6655 Principal (P) = Rs 5000 By using the formula, A = P $(1 + R/100)^n$ 6655 = 5000 $(1 + 10/100)^n$ 6655 = 5000 $(11/10)^n$ $(11/10)^n = 6655/5000$ $(11/10)^n = 1331/1000$ $(11/10)^n = (11/10)^3$ So on comparing both the sides, n = 3 \therefore Time required is 3years

9. In what time will Rs. 4400 become Rs. 4576 at 8% per annum interest compounded half-yearly? Solution:

Given details are, Rate = 8% per annum = 8/2 = 4% (half yearly) A = Rs 4576 Principal (P) = Rs 4400 Let n be '2T' By using the formula, A = P (1 + R/100)ⁿ 4576 = 4400 (1 + 4/100)^{2T} 4576 = 4400 (104/100)^{2T} (104/100)^{2T} = 4576/4400

 $(104/100)^{2T} = 26/25$ $(26/25)^{2T} = (26/25)^{1}$ So on comparing both the sides, n = 2T = 1 \therefore Time required is ¹/₂ year

10. The difference between the S.I. and C.I. on a certain sum of money for 2 years at 4% per annum is Rs. 20. Find the sum.

Solution:

Given details are, Rate = 4 % per annum Time = 2years Compound Interest (CI) – Simple Interest (SI)= Rs 20 By using the formula, CI - SI = 20 $P [(1 + R/100)^n - 1] - (PTR)/100 = 20$ $P [(1 + 4/100)^2 - 1] - (P(2)(4))/100 = 20$ P[51/625] - (2P)/25 = 20 51/625P - 2/25P = 20 (51P-50P)/625 = 20 $P = 20 \times 625$ P = 20/7.918 = 12500 \therefore The sum is Rs 12500

11. In what time will Rs. 1000 amount to Rs. 1331 at 10% per annum, compound interest?

Solution: Given details are, Principal = Rs 1000 Amount = Rs 1331 Rate = 10% per annum Let time = T years By using the formula, $A = P (1 + R/100)^n$ $1331 = 1000 (1 + 10/100)^T$ $1331 = 1000 (110/100)^T$ $(11/10)^T = 1331/1000$ $(11/10)^T = (11/10)^3$ So on comparing both the sides, n = T = 3

∴ Time required is 3years

12. At what rate percent compound interest per annum will Rs. 640 amount to Rs. 774.40 in 2 years? Solution:

Given details are. Principal = Rs 640Amount = Rs 774.40Time = 2 years Let rate = R%By using the formula, $A = P (1 + R/100)^n$ $774.40 = 640 (1 + R/100)^2$ $(1 + R/100)^2 = 774.40/640$ $(1 + R/100)^2 = 484/400$ $(1 + R/100)^2 = (22/20)^2$ By cancelling the powers on both sides, (1 + R/100) = (22/20)R/100 = 22/20 - 1=(22-20)/20= 2/20= 1/10R = 100/10= 10%

∴ Required Rate is 10% per annum

13. Find the rate percent per annum if Rs. 2000 amount to Rs. 2662 in 1 ½ years, interest being compounded half-yearly? Solution:

Given details are, Principal = Rs 2000 Amount = Rs 2662 Time = 1 $\frac{1}{2}$ years = $3/2 \times 2 = 3$ half years Let rate be = R% per annum = R/2 % half yearly By using the formula, A = P (1 + R/100)ⁿ 2662 = 2000 (1 + R/2×100)³ (1 + R/200)³ = 1331/1000 (1 + R/100)³ = (11/10)³

By cancelling the powers on both sides, (1 + R/200) = (11/10)R/200 = 11/10 − 1 = (11-10)/10 = 1/10R = 200/10 = 20%∴ Required Rate is 20% per annum

14. Kamala borrowed from Ratan a certain sum at a certain rate for two years simple interest. She lent this sum at the same rate to Hari for two years compound interest. At the end of two years she received Rs. 210 as compound interest, but paid Rs. 200 only as simple interest. Find the sum and the rate of interest.

```
Solution:
Given details are.
C.I that Kamala receives = Rs 210
S.I that Kamala paid = Rs 200
Time = 2 years
So.
We know, SI = PTR/100
              = P \times 2 \times R/100
         P \times R = 10000 ..... Equation 1
CI = A - P
CI = P [(1 + R/100)^n - 1]
210 = P [(1 + R/100)^2 - 1]
210 = P(1^2 + R^2/100^2 + 2(1)(R/100) - 1) (by using the formula (a+b)^2)
210 = P (1 + R^2 / 10000 + R / 50 - 1)
210 = P (R^2 / 10000 + R / 50)
210 = PR^2/10000 + PR/50
We know PR = 10000 from Equation 1
210 = 10000 \text{R} / 10000 + 10000 / 50
210 = R + 200
R = 210 - 200
  = 10\%
In Equation 1, PR = 10000
               P = 10000/R
                  = 10000/10
                  = 1000
\therefore Required sum is Rs 1000
```

15. Find the rate percent per annum, if Rs. 2000 amount to Rs. 2315.25 in a year and a half, interest being compounded six monthly. Solution:

Given details are, Principal = Rs 2000 Amount = Rs 2315.25 Time = 1 ¹/₂ years = 3/2 years Let rate be = R % per annum By using the formula, $A = P (1 + R/100)^n$ 2315.25 = 2000 (1 + R/100)^{3/2} (1 + R/100)^{3/2} = 2315.25/2000 (1 + R/100)^{3/2} = (1.1576) (1 + R/100) = 1.1025 R/100 = 1.1025 - 1 = 0.1025 × 100 = 10.25 \therefore Required Rate is 10.25% per annum

16. Find the rate at which a sum of money will double itself in 3 years, if the interest is compounded annually. Solution:

Given details are, Time = 3 years Let rate be = R %Also principal be = PSo, amount becomes = 2PBy using the formula, $A = P (1 + R/100)^n$ $2P = P (1 + R/100)^3$ $(1 + R/100)^3 = 2$ $(1 + R/100) = 2^{1/3}$ 1 + R/100 = 1.2599R/100 = 1.2599-1= 0.2599 $R = 0.2599 \times 100$ = 25.99∴ Required Rate is 25.99% per annum

17. Find the rate at which a sum of money will become four times the original amount in 2 years, if the interest is compounded half-yearly. Solution:

Given details are. Time = 2 years = $2 \times 2 = 4$ half years Let rate = R % per annum = R/2% half years Let principal be = PSo, Amount becomes = 4PBy using the formula, $A = P (1 + R/100)^n$ $4P = P (1 + R/2 \times 100)^4$ $(1 + R/200)^4 = 4$ $(1 + R/200) = 4^{1/4}$ 1 + R/200 = 1.4142R/200 = 1.4142-1= 0.4142 $R = 0.4142 \times 200$ = 82.84%∴ Required Rate is 82.84% per annum

18. A certain sum amounts to Rs. 5832 in 2 years at 8% compounded interest. Find the sum. Solution:

Given details are, Amount = Rs 5832 Time = 2 years Rate = 8% Let principal be = P By using the formula, $A = P (1 + R/100)^n$ $5832 = P (1 + 8/100)^2$ 5832 = P (1.1664) P = 5832/1.1664 = 5000 \therefore Required sum is Rs 5000

19. The difference between the compound interest and simple interest on a certain sum for 2 years at 7.5% per annum is Rs. 360. Find the sum.

Solution:

Given. Time = 2 years Rate = 7.5 % per annum Let principal = Rs PCompound Interest (CI) – Simple Interest (SI) = Rs 360 C.I - S.I = Rs 360By using the formula, $P[(1 + R/100)^{n} - 1] - (PTR)/100 = 360$ $P[(1 + 7.5/100)^2 - 1] - (P(2)(7.5))/100 = 360$ P[249/1600] - (3P)/20 = 360249/1600P - 3/20P = 360(249P-240P)/1600 = 360 $9P = 360 \times 1600$ P = 576000/9= 64000 \therefore The sum is Rs 64000

20. The difference in simple interest and compound interest on a certain sum of money at 6 2/3 % per annum for 3 years in Rs. 46. Determine the sum. Solution:

Given. Time = 3 years Rate = 62/3% per annum = 20/3%Let principal = Rs PCompound Interest (CI) – Simple Interest (SI) = Rs 46 C.I - S.I = Rs 46By using the formula, $P[(1 + R/100)^n - 1] - (PTR)/100 = 46$ $P[(1 + 20/3 \times 100)^3 - 1] - (P(3)(20/3))/100 = 46$ $P[(1 + 20/300)^3 - 1] - P/5 = 46$ P[721/3375] - P/5 = 46 721/3375P - 1/5P = 46(721P-675P)/3375 = 46 $46P = 46 \times 3375$ $46P = 46 \times 3375/46$ = 3375 \therefore The sum is Rs 3375

21. Ishita invested a sum of Rs. 12000 at 5% per annum compound interest. She received an amount of Rs. 13230 after n years. Find the value of n. Solution:

Given details are, Principal = Rs 12000 Amount = Rs 13230 Rate = 5% per annum Let time = T years By using the formula, $A = P (1 + R/100)^n$ $13230 = 12000 (1 + 5/100)^T$ $13230 = 12000 (105/100)^T$ $(21/20)^T = 13230/12000$ $(21/20)^T = 441/400$ $(21/20)^T = (21/20)^2$ So on comparing both the sides, n = T = 2 \therefore Time required is 2years

22. At what rate percent per annum will a sum of Rs. 4000 yield compound interest of Rs. 410 in 2 years? Solution:

Given details are. $Principal = Rs \ 4000$ Time = 2years CI = Rs 410Rate be = R% per annum By using the formula, $CI = P [(1 + R/100)^n - 1]$ $410 = 4000 \left[(1 + R/100)^2 - 1 \right]$ $410 = 4000 (1 + R/100)^2 - 4000$ $410 + 4000 = 4000 (1 + R/100)^2$ $(1 + R/100)^2 = 4410/4000$ $(1 + R/100)^2 = 441/400$ $(1 + R/100)^2 = (21/20)^2$ By cancelling the powers on both the sides, 1 + R/100 = 21/20R/100 = 21/20 - 1=(21-20)/20= 1/20

R = 100/20= 5 : Required Rate is 5% per annum

23. A sum of money deposited at 2% per annum compounded annually becomes Rs. 10404 at the end of 2 years. Find the sum deposited.

Solution:

Given details are, Time = 2years Amount = Rs 10404 Rate be = 2% per annum Let principal be = Rs P By using the formula, $A = P [(1 + R/100)^n \\ 10404 = P [(1 + 2/100)^2] \\ 10404 = P [1.0404] \\ P = 10404/1.0404 \\ = 10000$ \therefore Required sum is Rs 10000

24. In how much time will a sum of Rs. 1600 amount to Rs. 1852.20 at 5% per annum compound interest? Solution:

Given details are, Principal = Rs 1600 Amount = Rs 1852.20 Rate = 5% per annum Let time = T years By using the formula, $A = P (1 + R/100)^n$ 1852.20 = 1600 $(1 + 5/100)^T$ 1852.20 = 1600 $(105/100)^T$ (21/20)^T = 1852.20/1600 (21/20)^T = 9261/8000 (21/20)^T = (21/20)^3 So on comparing both the sides, n = T = 3 \therefore Time required is 3 years

25. At what rate percent will a sum of Rs. 1000 amount to Rs. 1102.50 in 2 years at

compound interest? Solution:

Given details are, Principal = Rs 1000 $Amount = Rs \ 1102.50$ Rate = R% per annum Let time = 2 years By using the formula, $A = P (1 + R/100)^n$ $1102.50 = 1000 (1 + R/100)^2$ $(1 + R/100)^2 = 1102.50/1000$ $(1 + R/100)^2 = 4410/4000$ $(1 + R/100)^2 = (21/20)^2$ 1 + R/100 = 21/20R/100 = 21/20 - 1=(21-20)/20= 1/20R = 100/20= 5 \therefore Required Rate is 5%

26. The compound interest on Rs. 1800 at 10% per annum for a certain period of time is Rs. 378. Find the time in years. Solution:

Given details are, Principal = Rs 1800 CI = Rs 378 Rate = 10% per annum Let time = T years By using the formula, CI = P $[(1 + R/100)^n - 1]$ 378 = 1800 $[(1 + 10/100)^T - 1]$ 378 = 1800 $[(11/100)^T - 1]$ 378 = 1800 $[(11/100)^T - 1]$ 378 = 1800 $[(11/100)^T - 1]$ 378 + 1800 = 1800 $[(11/100)^T - 1]$ (11/10)^T = 2178/1800 (11/10)^T = 726/600 (11/10)^T = 121/100 (11/10)^T = (11/10)²

So on comparing both the sides, n = T = 2 \therefore Time required is 2years

27. What sum of money will amount to Rs. 45582.25 at 6 ³/₄ % per annum in two years, interest being compounded annually?

Solution: Given details are, Time = 2years Amount = Rs 45582.25 Rate be = $6\frac{3}{4}\%$ per annum = 27/4%Let principal be = Rs PBy using the formula, $A = P [(1 + R/100)^n]$ $45582.25 = P [(1 + 27/4 \times 100)^2]$ $45582.25 = P (1 + 27/400)^2$ $45582.25 = P (427/400)^2$ $45582.25 = P \times 427/400 \times 427/400$ $P = (45582.25 \times 400 \times 400) / (427 \times 427)$ P = 7293160000/182329 =40000 \therefore Required sum is Rs 40000

28. Sum of money amounts to Rs. 453690 in 2 years at 6.5% per annum compounded annually. Find the sum.

Solution:

Given details are, Time = 2years Amount = Rs 453690 Rate be = 6.5 % per annum Let principal be = Rs P By using the formula, A = P [$(1 + R/100)^n$ 453690 = P [$(1 + 6.5/100)^2$] 453690 = P ($106.5/100 \times 106.5/100$ P = ($453690 \times 100 \times 100$) / (106.5×106.5) P = 4536900000/11342.25= 400000 \therefore Begiving a num is Ba 400000

∴ Required sum is Rs 400000

EXERCISE 14.4

P&GE NO: 14.27

1. The present population of a town is 28000. If it increases at the rate of 5% per annum, what will be its population after 2 years? Solution:

Given details are. Present population of town is = 28000Rate of increase in population is = 5% per annum Number of years = 2By using the formula, $A = P (1 + R/100)^n$ Population of town after 2 years = $28000 (1 + 5/100)^2$ $= 28000 (1.05)^{2}$ = 30870

∴ Population of town after 2 years will be 30870

2. The population of a city is 125000. If the annual birth rate and death rate are 5.5% and 3.5% respectively, calculate the population of city after 3 years. Solution:

Given details are, Population of city (P) = 125000Annual birth rate $R_1 = 5.5 \%$ Annual death rate $R_2 = 3.5$ % Annual increasing rate $R = (R_1 - R_2) = 5.5 - 3.5 = 2 \%$ Number of years = 3By using the formula, $A = P (1 + R/100)^n$ So, population after two years is = $125000 (1 + 2/100)^3$ $= 125000 (1.02)^{3}$ = 132651∴ Population after 3 years will be 132651

3. The present population of a town is 25000. It grows at 4%, 5% and 8% during first year, second year and third year respectively. Find its population after 3 years. Solution:

Given details are. Present population is = 25000First year growth $R_1 = 4\%$ Second year growth $R_2 = 5\%$

Third year growth $R_3 = 8\%$ Number of years = 3By using the formula, $A = P (1 + R/100)^n$ So, population after three years = P $(1 + R_1/100) (1 + R_2/100) (1 + R_3/100)$ = 25000(1 + 4/100)(1 + 5/100)(1 + 8/100)= 25000 (1.04) (1.05) (1.08)= 29484

∴ Population after 3 years will be 29484

4. Three years ago, the population of a town was 50000. If the annual increase during three successive years be at the rate of 4%, 5% and 3% respectively, find the ely present population.

Solution:

Given details are,

Three years ago population of town was = 50000

Annual increasing in 3 years = 4%, 5%, 3% respectively

So, let present population be = x

By using the formula,

 $A = P (1 + R/100)^n$

x = 50000 (1 + 4/100) (1 + 5/100) (1 + 3/100)

= 50000 (1.04) (1.05) (1.03)

```
= 56238
```

: Present population of the town is 56238

5. There is a continuous growth in population of a village at the rate of 5% per annum. If its present population is 9261, what it was 3 years ago? Solution:

Given details are, Present population of town is = 9261Continuous growth of population is = 5%So, let population three years ago be = xBy using the formula, $A = P (1 + R/100)^n$ 9261 = x (1 + 5/100) (1 + 5/100) (1 + 5/100)9261 = x (1.05) (1.05) (1.05)= 8000

 \therefore Present population of the town is 8000

6. In a factory the production of scooters rose to 46305 from 40000 in 3 years. Find the annual rate of growth of the production of scooters. Solution:

Given details are. Initial production of scooters is = 40000Final production of scooters is = 46305Time = 3 years Let annual growth rate be = R%By using the formula, $A = P (1 + R/100)^n$ 46305 = 40000 (1 + R/100) (1 + R/100) (1 + R/100) $46305 = 40000 (1 + R/100)^3$ $(1 + R/100)^3 = 46305/40000$ = 9261/8000 $=(21/20)^{3}$ 1 + R/100 = 21/20R/100 = 21/20 - 1R/100 = (21-20)/20= 1/20R = 100/20= 5

: Annual rate of growth of the production of scooters is 5%

7. The annual rate of growth in population of a certain city is 8%. If its present population is 196830, what it was 3 years ago? Solution:

Given details are, Annual growth rate of population of city is = 8% Present population of city is = 196830 Let population of city 3 years ago be = x By using the formula, A = P (1 + R/100) 196830 = x (1 + 8/100) (1 + 8/100) (1 + 8/100) 196830 = x (27/25) (27/25) (27/25) 196830 = x (1.08) (1.08) (1.08) 196830 = 1.259712x x = 196830/1.259712 = 156250 \therefore Population 3 years ago was 156250

8. The population of a town increases at the rate of 50 per thousand. Its population after 2 years will be 22050. Find its present population. Solution:

Given details are, Growth rate of population of town is = $50/1000 \times 100 = 5\%$ Population after 2 years is = 22050So, let present population of town be = x By using the formula, A = P (1 + R/100) 22050 = x (1 + 5/100) (1 + 5/100) 22050 = x (105/100) (105/100) 22050 = x (1.05) (1.05) 22050 = 1.1025x x = 22050/1.1025= 20000

 \therefore Present population of the town is 20000

9. The count of bacteria in a culture grows by 10% in the first hour, decreases by 8% in the second hour and again increases by 12% in the third hour. If the count of bacteria in the sample is 13125000, what will be the count of bacteria after 3 hours? Solution:

Given details are, Count of bacteria in sample is = 13125000 The increase and decrease of growth rates are = 10%, -8%, 12% So, let the count of bacteria after 3 hours be = x By using the formula, A = P (1 + R/100) x = 13125000 (1 + 10/100) (1 - 8/100) (1 + 12/100) x = 13125000 (110/100) (92/100) (112/100) x = 13125000 (1.1) (0.92) (1.12) = 14876400 \therefore Count of bacteria after three hours will be 14876400

10. The population of a certain city was 72000 on the last day of the year 1998. During next year it increased by 7% but due to an epidemic it decreased by 10% in the following year. What was its population at the end of the year 2000? Solution:

Given details are,

Population of city on last day of year 1998 = 72000

Increasing rate (R) in 1999 = 7%Decreasing rate (R) in 2000 = 10%By using the formula, A = P (1 + R/100)x = 72000 (1 + 7/100) (1 - 10/100)= 72000 (107/100) (90/100)= 72000 (1.07) (0.9)= 69336 \therefore Population at the end of the year 2000 will be 69336

11. 6400 workers were employed to construct a river bridge in four years. At the end of the first year, 25% workers were retrenched. At the end of the second year, 25% of those working at that time were retrenched. However, to complete the project in time, the number of workers was increased by 25% at the end of the third year. How many workers were working during the fourth year?

Solution:

Given details are,

Initial number of workers are = 6400

At the end of first year = 25% retrenched

At the end of second year = 25% retrenched

At the end of third year = 25% increased

By using the formula,

A = P (1 + R/100)

```
x = 6400 (1 - 25/100) (1 - 25/100) (1 + 25/100)
```

```
= 6400 (75/100) (75/100) (125/100)
```

```
= 6400 (0.75) (0.75) (1.25)
```

= 4500

 \therefore Number of workers working during the fourth year is 4500

12. Aman started a factory with an initial investment of Rs 100000. In the first year, he incurred a loss of 5%. However, during the second year, he earned a profit of 10% which in the third year rose to 12%. Calculate his net profit for the entire period of three years.

Solution:

Given details are,

Initial investment by Aman = Rs.100000

In first year = incurred a loss of 5%

In second year = earned a profit of 10%

In third year = earned a profit of 12 %

By using the formula,

$$A = P (1 + R/100)$$

$$\mathbf{x} = 100000 (1 - 5/100) (1 + 10/100) (1 + 12/100)$$

$$= 100000 (95/100) (110/100) (112/100)$$

$$= 100000 (0.95) (1.1) (1.12)$$

```
= 117040
```

: Aman's net profit for entire three years is 117040 - 100000 = Rs 17040

13. The population of a town increases at the rate of 40 per thousand annually. If the present population be 175760, what was the population three years ago. Solution:

Given,

Annul increase rate of population of town = $40/1000 \times 100 = 4\%$ Present population of town = 175760 So, let the population of town 3 years ago be = x By using the formula, A = P (1 + R/100) 175760 = x (1 + 4/100) (1 + 4/100) (1 + 4/100) 175760 = x (104/100) (104/100) (104/100) 175760 = x (1.04) (1.04) (1.04) 175760 = 1.124864x x = 175760/1.124864 = 156250 \therefore Population 3 years ago was 156250

14. The population of a mixi company in 1996 was 8000 mixies. Due to increase in demand it increases its production by 15% in the next two years and after two years its demand decreases by 5%. What will its production after 3 years? Solution:

Given,

Population of mixi company in 1996 was = 8000 mixies

Production growth rate in next 2 years is = 15 %

Decrease rate in 3^{rd} year is = 5%

By using the formula,

A = P (1 + R/100)

$$x = 8000 (1 + 15/100) (1 + 15/100) (1 - 5/100)$$

- = 8000 (115/100) (115/100) (95/100)
- = 8000(1.15)(1.15)(0.95)
- = 10051

 \therefore Production after three years will be 10051 mixies

15. The population of a city increases each year by 4% of what it had been at the beginning of each year. If the population in 1999 had been 6760000, find the population of the city in (1) 2001 (ii) 1997. Solution:

Given details are, Annual increase rate of population of city is = 4%Population in 1999 was = 6760000

- (i) Population of the city in 2001 (2 years after)
- By using the formula,

A = P (1 + R/100)

- x = 6760000 (1 + 4/100) (1 + 4/100)
 - = 6760000 (104/100) (104/100)
 - = 6760000 (1.04) (1.04)

 \therefore Population in the year 2001 is 7311616

(ii) Population of city in 1997 (2 years ago)

By using the formula,

A = P (1 + R/100)

- $\mathbf{x} = 6760000 \ (1 4/100) \ (1 4/100)$
 - = 6760000 (96/100) (96/100)
 - = 6760000 (0.96) (0.96)
 - = 6230016
- ∴ Population in the year 1997 was 6230016

16. Jitendra set up a factory by investing Rs. 2500000. During the first two successive years his profits were 5% and 10% respectively. If each year the profit was on previous year's capital, compute his total profit. Solution:

Given details are,

Initial investment by Jitendra was = Rs 2500000

Profit in first 2 successive years were = 5% and 10%

Final investment after two successive profits = 2500000 (1 + 5/100) (1 + 10/100)

= 2500000 (105/100) (110/100)

- = 2500000 (1.05) (1.1)
- = 2887500

: Jitendra total profit is = 2887500 - 2500000 = Rs 387500

EXERCISE 14.5

PAGE NO: 14.31

1. Ms. Cherian purchases a boat for Rs. 16000. If the total cost of the boat is depreciating at the rate of 5% per annum, calculate its value after 2 years. Solution:

Given details are,

Price of a boat is = Rs 16000

Depreciation rate = 5% per annum

By using the formula,

A = P (1 + R/100)

 $= P (1 + R/100)^2$

Since it is depreciation we use P $(1 - R/100)^n$

= 16000 (1 - 5/100) (1 - 5/100)

- = 16000 (95/100) (95/100)
- = 16000 (0.95) (0.95)
- = 14440
- : Value of the boat after two years is Rs 14440

2. The value of a machine depreciates at the rate of 10% per annum. What will be its value 2 years hence, if the present value is Rs 100000? Also, find the total depreciation during this period.

Solution:

Given details are,

Present value of machine is = Rs 100000

Rate of depreciation = 10% per annum

By using the formula,

A = P (1 + R/100)

- = 100000 (1 10/100) (1 10/100)
- = 100000 (90/100) (90/100)
- = 100000 (0.9) (0.9)
- = 81000

Value of machine after two years will be Rs 81000

 \therefore Total depreciation during this period is Rs (100000 - 81000) = Rs 19000

3. Pritam bought a plot of land for Rs. 640000. Its value is increasing by 5% of its previous value after every six months. What will be the value of the plot after 2 years?

Solution: Given details are.

Price of land is = Rs 640000 Rate of increase = 5% in every six month

By using the formula,

 $A = P (1 + R/100)^n$

= 640000 (1 + 5/100) (1 + 5/100) (1 + 5/100) (1 + 5/100)

= 640000 (105/100) (105/100) (105/100) (105/100)

= 640000 (1.025) (1.025) (1.025) (1.025)

= 706440.25

 \therefore The value of the plot after two years will be Rs 706440.25

4. Mohan purchased a house for Rs. 30000 and its value is depreciating at the rate of 25% per year. Find the value of the house after 3 years.

Solution:

Given details are,

Price of house is = Rs 30000

Depreciation rate is = 25% per year

By using the formula,

 $A = P (1 + R/100)^n$

```
= 30000 (1 - 25/100) (1 - 25/100) (1 - 25/100)
```

= 30000 (75/100) (75/100) (75/100)

= 30000 (0.75) (0.75) (0.75)

: The value of the house after 3 years is Rs 12656.25

5. The value of a machine depreciates at the rate of 10% per annum. It was purchased 3 years ago. If its present value is Rs. 43740, find its purchase price. Solution:

Given details are, Present value of machine is = Rs 43740 Depreciation rate of machine is = 10% per annum Let the purchase price 3 years ago be = Rs x By using the formula, $A = P (1 + R/100)^n$ 43740 = x (1 - 10/100) (1 - 10/100) (1 - 10/100) 43740 = x (90/100) (90/100) (90/100) 43740 = x (0.9) (0.9) (0.9) 43740 = 0.729x x = 43740/0.729= 60000

^{= 12656.25}

 \therefore The purchase price is Rs 60000

6. The value of a refrigerator which was purchased 2 years ago, depreciates at 12% per annum. If its present value is Rs. 9680, for how much was it purchased? Solution:

Given details are, Present value of refrigerator is = Rs 9680 Depreciation rate is = 12% Let the price of refrigerator 2 years ago be = Rs x By using the formula, $A = P (1 + R/100)^n$ 9680 = x (1 - 12/100) (1 - 12/100) 9680 = x (88/100) (88/100) 9680 = x (0.88) (0.88) 9680 = 0.7744x x = 9680/0.7744 = 12500 \therefore The refrigerator was purchased for Rs 12500

7. The cost of a T.V. set was quoted Rs. 17000 at the beginning of 1999. In the beginning of 2000 the price was hiked by 5%. Because of decrease in demand the cost was reduced by 4% in the beginning of 2001. What was the cost of the T.V. set in 2001?

Solution:

Given details are, Cost of T.V at beginning of 1999 is = Rs 17000 Hiked in price in the year 2000 is = 5% Depreciation rate in the year 2001 is = 4% By using the formula, $A = P (1 + R/100)^n$ = 17000 (1 + 5/100) (1 - 4/100) = 17000 (105/100) (96/100)

- = 17000 (1.05) (0.96)
- = 17136

 \therefore The cost of TV set in the year 2001 is Rs 17136

8. Ashish started the business with an initial investment of Rs. 500000. In the first year he incurred a loss of 4%. However during the second year he earned a profit of 5% which in third year rose to 10%. Calculate the net profit for the entire period of

3 years. Solution:

Given, Initial investment by Ashish is = Rs 500000 Incurred loss in the first year is = 4% Profit in 2^{nd} year is = 5 % Profit in 3^{rd} year is = 10% By using the formula, $A = P (1 + R/100)^n$ = 500000 (1 - 4/100) (1 + 5/100) (1 + 10/100) = 500000 (96/100) (105/100) (110/100) = 500000 (0.96) (1.05) (1.1)

= 554400

 \therefore The net profit for the entire period of 3 years is Rs 554400
