

Date of Exam: 8th January 2020 (Shift 2)

Time: 2:30 P.M. to 5:30 P.M.

Subject: Mathematics

- 1. Let *A* and *B* be two events such that the probability that exactly one of them occurs is $\frac{2}{5}$ and the probability that *A* or *B* occurs is $\frac{1}{2}$, then the probability of both of them occur together is
 - a. 0.10

b. 0.20

c. 0.01

d. 0.02

Answer: (a)

Solution:

$$P(A \text{ or } B) = P(A \cup B) = \frac{1}{2}$$

 $P(\text{exactly one of } A \text{ or } B) = \frac{2}{5}$

$$\Rightarrow P(A) - P(A \cap B) + P(B) - P(A \cap B) = \frac{2}{5}$$

$$\Rightarrow P(A \cup B) - P(A \cap B) = \frac{2}{5}$$

$$\Rightarrow P(A \cap B) = \frac{1}{10}$$

- 2. Let *S* be the set of all real roots of the equation, $3^x(3^x-1)+2=|3^x-1|+|3^x-2|$. Then *S*:
 - a. is a singleton.
 - b. is an empty set.
 - c. contains at least four elements
 - d. contains exactly two elements.

Answer: (a)

$$3^x(3^x - 1) + 2 = |3^x - 1| + |3^x - 2|$$

Let
$$3^x = t$$

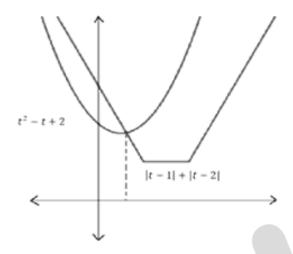

$$t(t-1) + 2 = |t-1| + |t-2|$$

$$\Rightarrow t^2-t+2=|t-1|+|t-2|$$

We plot $t^2 - t + 2$ and |t - 1| + |t - 2|

As 3^x is always positive, therefore only positive values of t will be the solution.

Therefore, we have only one solution.

- 3. The mean and variance of 20 observations are found to be 10 and 4, respectively. On rechecking, it was found that an observation 9 was incorrect and the correct observation was 11. Then the correct variance is:
 - a. 4.01
 - c. 3.98

- b. 3.99
- d. 4.02

Answer: (b)

Mean =
$$10 \Rightarrow \frac{\sum x_i}{20} = 10 \Rightarrow \sum x_i = 200$$

Variance =
$$4 \Rightarrow \frac{\sum x_i^2}{20} - 100 = 4 \Rightarrow \sum x_i^2 = 2080$$

New mean =
$$\frac{200-9+11}{20} = \frac{202}{20} = 10.1$$

New variance =
$$\frac{2080-81+121}{20} - (10.1)^2$$

= $106 - 102.01$
= 3.99

4. Let $\vec{a} = \hat{\imath} - 2\hat{\jmath} + \hat{k}$, $\vec{b} = \hat{\imath} - \hat{\jmath} + \hat{k}$ be two vectors. If \vec{c} is a vector such that $\vec{b} \times \vec{c} = \vec{b} \times \vec{a}$ and $\vec{c} \cdot \vec{a} = 0$ then $\vec{c} \cdot \vec{b}$ is equal to:

a.
$$\frac{1}{2}$$

c.
$$-\frac{1}{2}$$

b.
$$-\frac{3}{2}$$
 d. -1

d.
$$-1^{2}$$

Answer: (c)

Solution:

$$\overrightarrow{a} = \hat{\imath} - 2\hat{\jmath} + \hat{k}$$

$$\vec{b} = \hat{\imath} - \hat{\jmath} + \hat{k}$$

$$\vec{b} \times \vec{c} = \vec{b} \times \vec{a}$$

$$\Rightarrow \overrightarrow{a} \times \left(\overrightarrow{b} \times \overrightarrow{c}\right) = \overrightarrow{a} \times \left(\overrightarrow{b} \times \overrightarrow{a}\right)$$

$$\Rightarrow (\overrightarrow{a}.\overrightarrow{c})\overrightarrow{b} - (\overrightarrow{a}.\overrightarrow{b})\overrightarrow{c} = (\overrightarrow{a}.\overrightarrow{a})\overrightarrow{b} - (\overrightarrow{a}.\overrightarrow{b})\overrightarrow{a}$$

$$\Rightarrow - \left(\overrightarrow{a}.\overrightarrow{b}\right)\overrightarrow{c} = (\overrightarrow{a}.\overrightarrow{a})\overrightarrow{b} - \left(\overrightarrow{a}.\overrightarrow{b}\right)\overrightarrow{a}$$

$$\Rightarrow -4\vec{c} = 6(\hat{\imath} - \hat{\jmath} + \hat{k}) - 4(\hat{\imath} - 2\hat{\jmath} + \hat{k})$$

$$\Rightarrow \overrightarrow{c} = -\frac{1}{2}(\hat{\imath} + \hat{\jmath} + \hat{k})$$

$$\therefore \overrightarrow{b} \cdot \overrightarrow{c} = -\frac{1}{2}.$$

5. Let $f:(1,3) \to R$ be a function defined by $f(x) = \frac{x[x]}{x^2+1}$, where [x] denotes the greatest integer \le x. Then the range of f is:

a.
$$\left(\frac{2}{5}, \frac{3}{5}\right] \cup \left(\frac{3}{4}, \frac{4}{5}\right)$$

c.
$$\left(\frac{3}{5}, \frac{4}{5}\right)$$

b.
$$\left(\frac{2}{5}, \frac{4}{5}\right]$$

b.
$$\left(\frac{2}{5}, \frac{4}{5}\right]$$

d. $\left(\frac{2}{5}, \frac{1}{2}\right) \cup \left(\frac{3}{5}, \frac{4}{5}\right]$

Answer: (d)

$$f(x) = \frac{x[x]}{x^2 + 1}$$

$$\Rightarrow f(x) = \begin{cases} \frac{x}{x^2 + 1} : 1 < x < 2\\ \frac{2x}{x^2 + 1} : 2 \le x < 3 \end{cases}$$

$$\Rightarrow$$
 Range of $f(x)$ is $\left(\frac{2}{5}, \frac{1}{2}\right) \cup \left(\frac{3}{5}, \frac{4}{5}\right]$.

6. If α and β be the coefficients of x^4 and x^2 respectively in the expansion of $\left(x + \sqrt{x^2 - 1}\right)^6 + \left(x - \sqrt{x^2 - 1}\right)^6$, then:

a.
$$\alpha + \beta = -30$$

c.
$$\alpha + \beta = 60$$

b.
$$\alpha - \beta = -132$$

d.
$$\alpha - \beta = 60$$

Solution:

$$(x + \sqrt{x^2 - 1})^6 + (x - \sqrt{x^2 - 1})^6$$

$$= 2[{}^6C_0x^6 + {}^6C_2x^4(x^2 - 1) + {}^6C_4x^2(x^2 - 1)^2 + {}^6C_6(x^2 - 1)^3]$$

$$= 2[32x^6 - 48x^4 + 18x^2 - 1]$$

$$\Rightarrow \alpha = -96, \qquad \beta = 36$$

$$\Rightarrow \alpha - \beta = -132$$

7. If a hyperbola passes through the point P(10, 16) and it has vertices at $(\pm 6, 0)$, then the equation of the normal at P is:

a.
$$3x + 4y = 94$$

b.
$$x + 2y = 42$$

c.
$$2x + 5y = 100$$

d.
$$x + 3y = 58$$

Answer: (c)

Solution:

Vertex of hyperbola is $(\pm a, 0) \equiv (\pm 6, 0) \Rightarrow a = 6$

Equation of hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$$\Rightarrow \frac{x^2}{36} - \frac{y^2}{h^2} = 1$$

As P(10, 16) lies on the parabola.

$$\frac{100}{36} - \frac{256}{b^2} = 1$$

$$\Rightarrow \frac{64}{36} = \frac{256}{b^2} \Rightarrow b^2 = 144$$

Equation of hyperbola becomes $\frac{x^2}{36} - \frac{y^2}{144} = 1$

Equation of normal is $\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$

$$\Rightarrow \frac{36x}{10} + \frac{144y}{16} = 180$$

$$\Rightarrow \frac{x}{50} + \frac{y}{20} = 1 \Rightarrow 2x + 5y = 100$$

- a. 0
- c. $-\frac{1}{10}$

- b. $\frac{1}{10}$
- d. $-\frac{1}{5}$

Answer: (a)

Solution:

$$\lim_{x \to 0} \frac{\int_0^x t \sin 10t \, dt}{x}$$

Applying L'Hospital's Rule:

$$=\lim_{x\to 0}\frac{x\sin 10x}{1}=0$$

9. If a line, y = mx + c is a tangent to the circle, $(x - 3)^2 + y^2 = 1$ and it is perpendicular to a line L_1 , where L_1 is the tangent to the circle, $x^2 + y^2 = 1$ at the point $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$; then:

a.
$$c^2 + 7c + 6 = 0$$

b.
$$c^2 - 6c + 7 = 0$$

c.
$$c^2 - 7c + 6 = 0$$

d.
$$c^2 + 6c + 7 = 0$$

Answer: (d)

Solution:

For circle, $x^2 + y^2 = 1$

$$2x + 2yy' = 0 \Rightarrow y' = -\frac{x}{y}$$

Slope of tangent to $x^2 + y^2 = 1$ at $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) = -1$

 \Rightarrow Slope of tangent to $(x-3)^2 + y^2 = 1$ is $1 \Rightarrow m = 1$

Tangent to $(x - 3)^2 + y^2 = 1$ is y = x + c

Perpendicular distance of tangent y = x + c from centre (3,0) is equal to radius = 1

$$\left| \frac{3+c}{\sqrt{2}} \right| = 1$$

$$\Rightarrow c + 3 = \pm \sqrt{2}$$

$$\Rightarrow c^2 + 6c + 9 = 2$$

$$\Rightarrow c^2 + 6c + 7 = 0$$

10. Let $\alpha = \frac{-1+i\sqrt{3}}{2}$. If $a = (1+\alpha)\sum_{k=0}^{100}\alpha^{2k}$ and $b = \sum_{k=0}^{100}\alpha^{3k}$, then a and b are the roots of the quadratic equation:

a.
$$x^2 + 101x + 100 = 0$$

c.
$$x^2 - 102x + 101 = 0$$

b.
$$x^2 + 102x + 101 = 0$$

d.
$$x^2 - 101x + 100 = 0$$

Answer: (c)

Solution:

$$\alpha = \frac{-1+i\sqrt{3}}{2} = \omega$$

$$a = (1 + \alpha) \sum_{k=0}^{100} \alpha^{2k}$$

$$\Rightarrow \alpha = (1+\alpha)[1+\alpha^2+\alpha^4+\cdots.+\alpha^{200}]$$

$$\Rightarrow a = (1 + \alpha) \left[\frac{1 - (\alpha^2)^{101}}{1 - \alpha^2} \right]$$

$$\Rightarrow a = \left[\frac{1 - (\omega^2)^{101}}{1 - \omega}\right] = \left[\frac{1 - \omega}{1 - \omega}\right] = 1$$

$$b = \sum_{k=0}^{100} \alpha^{3k} = 1 + \alpha^3 + \alpha^6 + \dots + \alpha^{300}$$

$$\Rightarrow b = 1 + \omega^3 + \omega^6 + \dots + \omega^{300}$$

$$\Rightarrow b = 101$$

Required equation is $x^2 - 102x + 101 = 0$

11. The mirror image of the point (1, 2, 3) in a plane is $\left(-\frac{7}{3}, -\frac{4}{3}, -\frac{1}{3}\right)$. Which of the following points lies on this plane?

a.
$$(1, -1, 1)$$

Answer: (a)

Solution:

Image of point P(1, 2, 3) w.r.t. a plane ax + by + cz + d = 0 is $Q(-\frac{7}{3}, -\frac{4}{3}, -\frac{1}{3})$

Direction ratios of $PQ: -\frac{10}{3}, -\frac{10}{3}, -\frac{10}{3} = 1, 1, 1$

Direction ratios of normal to plane is 1, 1, 1

Mid-point of *PQ* lies on the plane

$$\therefore \text{ The mid-point of } PQ = \left(-\frac{2}{3}, \frac{1}{3}, \frac{4}{3}\right)$$

$$\therefore \text{ Equation of plane is } x + \frac{2}{3} + y - \frac{1}{3} + z - \frac{4}{3} = 0$$

$$\Rightarrow x + y + z = 1$$

(1,-1, 1) satisfies the equation of the plane.

12. The length of the perpendicular from the origin, on the normal to the curve, $x^2 + 2xy - 3y^2 = 0$ at the point (2, 2) is:

c.
$$4\sqrt{2}$$

b.
$$2\sqrt{2}$$

d.
$$\sqrt{2}$$

Answer: (b)

Solution:

Given curve: $x^2 + 2xy - 3y^2 = 0$

$$\Rightarrow x^2 + 3xy - xy - 3y^2 = 0$$

$$\Rightarrow (x+3y)(x-y)=0$$

Equating we get,

$$x + 3y = 0 \text{ or } x - y = 0$$

(2, 2) lies on
$$x - y = 0$$

 \therefore Equation of normal will be $x + y = \lambda$

It passes through (2, 2)

$$\lambda = 4$$

$$L: x + y = 4$$

Distance of *L* from the origin = $\left|\frac{-4}{\sqrt{2}}\right| = 2\sqrt{2}$

13. Which of the following statements is a tautology?

a.
$$\sim (p \land \sim q) \rightarrow (p \lor q)$$

c.
$$p \lor (\sim q) \rightarrow (p \land q)$$

b.
$$(\sim p \lor \sim q) \to (p \land q)$$

d.
$$\sim (p \lor \sim q) \rightarrow (p \lor q)$$

Answer: (d)

Solution:

$${\sim}(p \vee {\sim} q) \to (p \vee q)$$

$$= (p \lor \sim q) \lor (p \lor q)$$

$$= (p \lor p) \lor (q \lor \sim q)$$

$$= p \vee T$$

$$= T$$

14. If
$$I = \int_1^2 \frac{dx}{\sqrt{2x^3 - 9x^2 + 12x + 4}}$$
, then:

a.
$$\frac{1}{6} < I^2 < \frac{1}{2}$$

c.
$$\frac{1}{9} < I^2 < \frac{1}{8}$$

b.
$$\frac{1}{8} < I^2 < \frac{1}{4}$$

d.
$$\frac{1}{16} < I^2 < \frac{1}{9}$$

Answer: (c)

Let
$$f(x) = \frac{1}{\sqrt{2x^3 - 9x^2 + 12x + 4}}$$

$$f'(x) = \frac{-(6x^2 - 18x + 12)}{2(2x^3 - 9x^2 + 12x + 4)^{3/2}} = \frac{-3(x - 1)(x - 2)}{(2x^3 - 9x^2 + 12x + 4)^{3/2}}$$

$$\Rightarrow f_{min} = f(1) \text{ and } f_{max} = f(2)$$

$$f(1) = \frac{1}{\sqrt{2-9+12+4}} = \frac{1}{\sqrt{9}} = \frac{1}{3}$$

$$f(2) = \frac{1}{\sqrt{16 - 36 + 24 + 4}} = \frac{1}{\sqrt{8}}$$

$$\frac{1}{3} < I < \frac{1}{\sqrt{8}}$$

$$\Rightarrow \frac{1}{9} < I^2 < \frac{1}{8}$$

15. If $A = \begin{bmatrix} 2 & 2 \\ 9 & 4 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then $10A^{-1}$ is equal to:

a. 6I - A

b. A - 6I

c. 4I - A

d. A-4I

Answer: (b)

Solution:

$$A = \begin{bmatrix} 2 & 2 \\ 9 & 4 \end{bmatrix}$$

$$A^{-1} = -\frac{1}{10} \begin{bmatrix} 4 & -2 \\ -9 & 2 \end{bmatrix}$$

$$\Rightarrow 10A^{-1} = \begin{bmatrix} -4 & 2 \\ 9 & -2 \end{bmatrix} \Rightarrow 10A^{-1} = A - 6I$$

16. The area (in sq. units) of the region $\{(x,y) \in \mathbb{R}^2 : x^2 \le y \le 3 - 2x\}$, is:

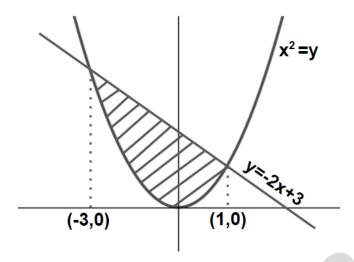

a. $\frac{31}{3}$ b. $\frac{32}{3}$ c. $\frac{29}{3}$ d. $\frac{34}{3}$

Answer: (b)

Solution:

We have $x^2 \le y \le -2x + 3$

For point of intersection of two curves

$$x^2 + 2x - 3 = 0$$

$$\Rightarrow x = -3, 1$$

$$\Rightarrow$$
 Area = $\int_{-3}^{1} ((-2x+3) - x^2) dx$

$$= \left[-x^2 + 3x - \frac{x^3}{3} \right]_{-3}^{1} = \frac{32}{3} \text{ sq. units.}$$

17. Let S be the set of all functions $f:[0,1] \to \mathbb{R}$, which are continuous on [0,1] and differentiable on (0,1). Then for every f in S, there exists a $c \in (0,1)$, depending on f, such that:

a.
$$\frac{f(1)-f(c)}{1-c} = f'(c)$$

b.
$$|f(c) - f(1)| < |f'(c)|$$

c.
$$|f(c) + f(1)| < (1+c)|f'(c)|$$

d.
$$|f(c) - f(1)| < (1 - c)|f'(c)|$$

Answer: (Bonus)

Solution:

S is set of all functions.

If we consider a constant function, then option 2, 3 and 4 are incorrect.

For option 1:

$$\frac{f(1) - f(c)}{1 - c} = f'(c)$$

This may not be true for $f(x) = x^2$

None of the option are correct

18. The differential equation of the family of curves, $x^2 = 4b(y + b)$, $b \in \mathbf{R}$, is:

a.
$$xy'' = y'$$

b.
$$x(y')^2 = x + 2yy'$$

c.
$$x(y')^2 = x - 2yy'$$

d.
$$x(y')^2 = 2yy' - x$$

Answer: (b)

Solution:

$$x^2 = 4b(y+b)$$

...(1)

Differentiating both the sides w.r.t. x, we get

$$\Rightarrow 2x = 4by'$$

$$\Rightarrow b = \frac{x}{2y'}$$

Putting the value of b in (1), we get

$$\Rightarrow x^2 = \frac{2x}{y'} \left(y + \frac{x}{2y'} \right)$$

$$\Rightarrow x^2 = \frac{2xy}{y'} + \frac{x^2}{y'^2}$$

$$\Rightarrow x(y')^2 = 2yy' + x$$

19. The system of linear equations

$$\lambda x + 2y + 2z = 5$$

$$2\lambda x + 3y + 5z = 8$$

$$4x + \lambda y + 6z = 10$$
 has:

a. no solution when
$$\lambda = 2$$

b. infinitely many solutions when $\lambda = 2$

c. no solution when $\lambda = 8$

d. a unique solution when $\lambda = -8$

Answer: (a)

$$D = \begin{bmatrix} \lambda & 2 & 2 \\ 2\lambda & 3 & 5 \\ 4 & \lambda & 6 \end{bmatrix} = 18\lambda - 5\lambda^2 - 24\lambda + 40 + 4\lambda^2 - 24$$

$$\Rightarrow D = -\lambda^2 - 6\lambda + 16$$

Now,
$$D = 0$$

$$\Rightarrow \lambda^2 + 6\lambda - 16 = 0$$

$$\Rightarrow \lambda = -8 \text{ or } 2$$

For $\lambda = 2$

$$D_1 = \begin{bmatrix} 5 & 2 & 2 \\ 8 & 3 & 5 \\ 10 & 2 & 6 \end{bmatrix} = 40 + 4 - 28 \neq 0$$

 \therefore Equations have no solution for $\lambda = 2$.

20. If the 10^{th} term of an A.P. is $\frac{1}{20}$ and its 20^{th} term is $\frac{1}{10}$, then the sum of its first 200 terms is:

a. $50\frac{1}{4}$

b. 100

c. 50

d. $100\frac{1}{2}$

Answer: (d)

Solution:

$$T_{10} = \frac{1}{20}$$
, $T_{20} = \frac{1}{10}$

$$T_{20} - T_{10} = 10d$$

$$\Rightarrow \frac{1}{20} = 10d$$

$$d = \frac{1}{200}$$

$$\therefore a = \frac{1}{200}$$

$$S_{200} = \frac{200}{2} \left[2 \left(\frac{1}{100} \right) + 199 \left(\frac{1}{200} \right) \right]$$

$$=100\frac{1}{2}$$

21. Let a line y = mx (m > 0) intersect the parabola, $y^2 = x$ at a point P, other than the origin. Let the tangent to it at P meet the x —axis at the point Q. If area (ΔOPQ) = 4 sq. units, then m is equal to ______.

Answer: (0.5)

Solution:

Let the co-ordinates of P be (t^2, t)

Equation of tangent at $P(t^2, t)$ is $y - t = \frac{1}{2t}(x - t^2)$

Therefore, co-ordinates of Q will be $(-t^2, 0)$

Area of $\Delta OPQ = 4$

$$\Rightarrow \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ t^2 & t & 1 \\ -t^2 & 0 & 1 \end{vmatrix} = \pm 4$$

$$\Rightarrow t^3 = \pm 8 \Rightarrow t = \pm 2 \Rightarrow t = 2 \text{ as } t > 0$$

$$m = \frac{1}{t} = \frac{1}{2}$$

22. Let f(x) be a polynomial of degree 3 such that f(-1) = 10, f(1) = -6, f(x) has a critical point at x = -1 and f'(x) has a critical point at x = 1. Then the local minima at x =____

Answer: (3)

Solution:

Let the polynomial be

$$f(x) = ax^{3} + bx^{2} + cx + d$$

$$\Rightarrow f'(x) = 3ax^{2} + 2bx + c$$

$$\Rightarrow f''(x) = 6ax + 2b$$

$$f''(1) = 0 \Rightarrow 6a + 2b = 0 \Rightarrow b = -3a$$

$$f'(-1) = 0 \Rightarrow 3a - 2b + c = 0$$

$$\Rightarrow c = -9a$$

$$f(-1) = 10 \Rightarrow -a + b - c + d = 10$$

$$\Rightarrow -a - 3a + 9a + d = 10$$

$$d = -5a + 10$$

$$f(1) = 6 \Rightarrow a + b + c + d = 6$$

$$\Rightarrow a - 3a - 9a - 5a + 10 = 6$$

$$\Rightarrow a = \frac{1}{4}$$

$$\therefore f'(x) = \frac{3}{4}x^{2} - \frac{6}{4}x - \frac{9}{4} = \frac{3}{4}(x^{2} - 2x - 3)$$

For $f'(x) = 0 \Rightarrow x^2 - 2x - 3 = 0 \Rightarrow x = 3, -1$

Minima exists at x = 3

23. If
$$\frac{\sqrt{2}\sin\alpha}{\sqrt{1+\cos 2\alpha}} = \frac{1}{7}$$
 and $\sqrt{\frac{1-\cos 2\beta}{2}} = \frac{1}{\sqrt{10}}$, $\alpha, \beta \in (0, \frac{\pi}{2})$, then $\tan(\alpha + 2\beta)$ is equal to ______.

Answer: (1)

Solution:

$$\frac{\sqrt{2}\sin\alpha}{\sqrt{1+\cos2\alpha}} = \frac{1}{7} \Rightarrow \frac{\sqrt{2}\sin\alpha}{\sqrt{2}\cos\alpha} = \frac{1}{7} \Rightarrow \tan\alpha = \frac{1}{7}$$

$$\sqrt{\frac{1-\cos 2\beta}{2}} = \frac{1}{\sqrt{10}} \Rightarrow \frac{\sqrt{2}\sin\beta}{\sqrt{2}} = \frac{1}{\sqrt{10}} \Rightarrow \sin\beta = \frac{1}{\sqrt{10}} \Rightarrow \tan\beta = \frac{1}{3}$$

$$\tan 2\beta = \frac{2\tan \beta}{1 - \tan^2 \beta} = \frac{\frac{2}{3}}{1 - \frac{1}{9}} = \frac{3}{4}$$

$$\tan(\alpha + 2\beta) = \frac{\tan\alpha + \tan 2\beta}{1 - \tan\alpha \tan 2\beta} = \frac{\frac{1}{7} + \frac{3}{4}}{1 - \frac{1}{7} \times \frac{3}{4}} = 1$$

24. The number of 4 letter words (with or without meaning) that can be made from the eleven letters of the word "EXAMINATION" is ______.

Answer: (2454)

Solution:

Word "EXAMINATION" consists of 2A, 2I, 2N, E, X, M, T, O

Case I: All different letters are selected

Number of words formed = ${}^{8}C_{4} \times 4! = 1680$

Case II: 2 letters are same and 2 are different

Number of words formed = ${}^{3}C_{1} \times {}^{7}C_{2} \times \frac{4!}{2!} = 756$

Case III: 2 pair of letters are same

Number of words formed = ${}^{3}C_{2} \times \frac{4!}{2! \times 2!} = 18$

Total number of words formed = 1680 + 756 + 18 = 2454

25. The sum, $\sum_{n=1}^{7} \frac{n(n+1)(2n+1)}{4}$ is equal to _____.

Disclaimer: The questions were sourced based on memory and the details might vary from the actual questions.

Answer: (504)

$$\sum_{n=1}^{7} \frac{n(n+1)(2n+1)}{4}$$

$$= \frac{1}{4} \sum_{n=1}^{7} (2n^3 + 3n^2 + n)$$

$$= \frac{1}{4} \left[2 \sum_{n=1}^{7} n^3 + 3 \sum_{n=1}^{7} n^2 + \sum_{n=1}^{7} n \right]$$

$$= \frac{1}{4} \left[2 \times \left(\frac{7 \times 8}{2} \right)^2 + 3 \times \frac{7 \times 8 \times 15}{6} + \frac{7 \times 8}{2} \right]$$

$$= \frac{1}{4} \left[2 \times 784 + 420 + 28 \right] = 504$$
