

### Exercise 2.1

1. If  $\left(\frac{x}{3}+1, y-\frac{2}{3}\right) = \left(\frac{5}{3}, \frac{1}{3}\right)$ , find the values of  $x$  and  $y$ .

**Solution:**

$$\text{Given, } \left(\frac{x}{3}+1, y-\frac{2}{3}\right) = \left(\frac{5}{3}, \frac{1}{3}\right)$$

As the ordered pairs are equal, the corresponding elements should also be equal.

Thus,

$$x/3 + 1 = 5/3 \quad \text{and} \quad y - 2/3 = 1/3$$

Solving, we get

$$\begin{aligned} x + 3 = 5 & \quad \text{and} \quad 3y - 2 = 1 & \quad \text{[Taking L.C.M and adding]} \\ x = 2 & \quad \text{and} \quad 3y = 3 \end{aligned}$$

Therefore,

$$x = 2 \text{ and } y = 1$$

2. If the set  $A$  has 3 elements and the set  $B = \{3, 4, 5\}$ , then find the number of elements in  $(A \times B)$ ?

**Solution:**

Given, set  $A$  has 3 elements and the elements of set  $B$  are  $\{3, 4, \text{ and } 5\}$ .

So, the number of elements in set  $B = 3$

$$\begin{aligned} \text{Then, the number of elements in } (A \times B) &= (\text{Number of elements in } A) \times (\text{Number of elements in } B) \\ &= 3 \times 3 = 9 \end{aligned}$$

Therefore, the number of elements in  $(A \times B)$  will be 9.

3. If  $G = \{7, 8\}$  and  $H = \{5, 4, 2\}$ , find  $G \times H$  and  $H \times G$ .

**Solution:**

$$\text{Given, } G = \{7, 8\} \text{ and } H = \{5, 4, 2\}$$

We know that,

The Cartesian product of two non-empty sets  $P$  and  $Q$  is given as

$$P \times Q = \{(p, q) : p \in P, q \in Q\}$$

So,

$$G \times H = \{(7, 5), (7, 4), (7, 2), (8, 5), (8, 4), (8, 2)\}$$

$$H \times G = \{(5, 7), (5, 8), (4, 7), (4, 8), (2, 7), (2, 8)\}$$

4. State whether each of the following statements are true or false. If the statement is false, rewrite the given statement correctly.

(i) If  $P = \{m, n\}$  and  $Q = \{n, m\}$ , then  $P \times Q = \{(m, n), (n, m)\}$ .

(ii) If  $A$  and  $B$  are non-empty sets, then  $A \times B$  is a non-empty set of ordered pairs  $(x, y)$  such that  $x \in A$  and  $y \in B$ .

(iii) If  $A = \{1, 2\}$ ,  $B = \{3, 4\}$ , then  $A \times (B \cap \Phi) = \Phi$ .

**Solution:**

(i) The statement is False. The correct statement is:

If  $P = \{m, n\}$  and  $Q = \{n, m\}$ , then

$$P \times Q = \{(m, m), (m, n), (n, m), (n, n)\}$$

(ii) True

(iii) True

**5. If  $A = \{-1, 1\}$ , find  $A \times A \times A$ .**

**Solution:**

The  $A \times A \times A$  for a non-empty set  $A$  is given by

$$A \times A \times A = \{(a, b, c) : a, b, c \in A\}$$

Here, given  $A = \{-1, 1\}$

So,

$$A \times A \times A = \{(-1, -1, -1), (-1, -1, 1), (-1, 1, -1), (-1, 1, 1), (1, -1, -1), (1, -1, 1), (1, 1, -1), (1, 1, 1)\}$$

**6. If  $A \times B = \{(a, x), (a, y), (b, x), (b, y)\}$ . Find  $A$  and  $B$ .**

**Solution:**

Given,

$$A \times B = \{(a, x), (a, y), (b, x), (b, y)\}$$

We know that the Cartesian product of two non-empty sets  $P$  and  $Q$  is given by:

$$P \times Q = \{(p, q) : p \in P, q \in Q\}$$

Hence,  $A$  is the set of all first elements and  $B$  is the set of all second elements.

Therefore,  $A = \{a, b\}$  and  $B = \{x, y\}$

**7. Let  $A = \{1, 2\}$ ,  $B = \{1, 2, 3, 4\}$ ,  $C = \{5, 6\}$  and  $D = \{5, 6, 7, 8\}$ . Verify that**

**(i)  $A \times (B \cap C) = (A \times B) \cap (A \times C)$**

**(ii)  $A \times C$  is a subset of  $B \times D$**

**Solution:**

Given,

$$A = \{1, 2\}, B = \{1, 2, 3, 4\}, C = \{5, 6\} \text{ and } D = \{5, 6, 7, 8\}$$

(i) To verify:  $A \times (B \cap C) = (A \times B) \cap (A \times C)$

$$\text{Now, } B \cap C = \{1, 2, 3, 4\} \cap \{5, 6\} = \Phi$$

Thus,

$$\text{L.H.S.} = A \times (B \cap C) = A \times \Phi = \Phi$$

Next,

$$A \times B = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 1), (2, 2), (2, 3), (2, 4)\}$$

$$A \times C = \{(1, 5), (1, 6), (2, 5), (2, 6)\}$$

Thus,

$$\text{R.H.S.} = (A \times B) \cap (A \times C) = \Phi$$

Therefore,  $\text{L.H.S.} = \text{R.H.S.}$

- Hence verified

(ii) To verify:  $A \times C$  is a subset of  $B \times D$

First,

$$A \times C = \{(1, 5), (1, 6), (2, 5), (2, 6)\}$$

And,

$$B \times D = \{(1, 5), (1, 6), (1, 7), (1, 8), (2, 5), (2, 6), (2, 7), (2, 8), (3, 5), (3, 6), (3, 7), (3, 8), (4, 5), (4, 6), (4, 7), (4, 8)\}$$

Now, it's clearly seen that all the elements of set  $A \times C$  are the elements of set  $B \times D$ .

Thus,  $A \times C$  is a subset of  $B \times D$ .

- Hence verified

**8. Let  $A = \{1, 2\}$  and  $B = \{3, 4\}$ . Write  $A \times B$ . How many subsets will  $A \times B$  have? List them.**

**Solution:**

Given,

$$A = \{1, 2\} \text{ and } B = \{3, 4\}$$

So,

$$A \times B = \{(1, 3), (1, 4), (2, 3), (2, 4)\}$$

Number of elements in  $A \times B$  is  $n(A \times B) = 4$

We know that,

If  $C$  is a set with  $n(C) = m$ , then  $n[P(C)] = 2^m$ .

Thus, the set  $A \times B$  has  $2^4 = 16$  subsets.

And, these subsets are as below:

$$\Phi, \{(1, 3)\}, \{(1, 4)\}, \{(2, 3)\}, \{(2, 4)\}, \{(1, 3), (1, 4)\}, \{(1, 3), (2, 3)\}, \{(1, 3), (2, 4)\}, \{(1, 4), (2, 3)\}, \{(1, 4), (2, 4)\}, \{(2, 3), (2, 4)\}, \{(1, 3), (1, 4), (2, 3)\}, \{(1, 3), (1, 4), (2, 4)\}, \{(1, 3), (2, 3), (2, 4)\}, \{(1, 4), (2, 3), (2, 4)\}, \{(1, 3), (1, 4), (2, 3), (2, 4)\}$$

**9. Let  $A$  and  $B$  be two sets such that  $n(A) = 3$  and  $n(B) = 2$ . If  $(x, 1)$ ,  $(y, 2)$ ,  $(z, 1)$  are in  $A \times B$ , find  $A$  and  $B$ , where  $x$ ,  $y$  and  $z$  are distinct elements.**

**Solution:**

Given,

$$n(A) = 3 \text{ and } n(B) = 2; \text{ and } (x, 1), (y, 2), (z, 1) \text{ are in } A \times B.$$

We know that,

$A$  = Set of first elements of the ordered pair elements of  $A \times B$

$B$  = Set of second elements of the ordered pair elements of  $A \times B$ .

So, clearly  $x$ ,  $y$ , and  $z$  are the elements of  $A$ ; and

1 and 2 are the elements of  $B$ .

As  $n(A) = 3$  and  $n(B) = 2$ , it is clear that set  $A = \{x, y, z\}$  and set  $B = \{1, 2\}$ .

**10. The Cartesian product  $A \times A$  has 9 elements among which are found  $(-1, 0)$  and  $(0, 1)$ . Find the set  $A$  and the remaining elements of  $A \times A$ .**

**Solution:**

We know that,

If  $n(A) = p$  and  $n(B) = q$ , then  $n(A \times B) = pq$ .

Also,  $n(A \times A) = n(A) \times n(A)$

Given,

$$n(A \times A) = 9$$

So,  $n(A) \times n(A) = 9$

Thus,  $n(A) = 3$

Also given that, the ordered pairs  $(-1, 0)$  and  $(0, 1)$  are two of the nine elements of  $A \times A$ .

And, we know in  $A \times A = \{(a, a) : a \in A\}$ .

Thus,  $-1, 0,$  and  $1$  has to be the elements of  $A$ .

As  $n(A) = 3$ , clearly  $A = \{-1, 0, 1\}$ .

Hence, the remaining elements of set  $A \times A$  are as follows:

$(-1, -1), (-1, 1), (0, -1), (0, 0), (1, -1), (1, 0),$  and  $(1, 1)$
