

## PRACTICE SET 8.1

PAGE NO: 43

**1. Construct the following quadrilaterals of given measures.**

(1) In  $\square$  MORE,  $l(MO) = 5.8 \text{ cm}$ ,  $l(OR) = 4.4 \text{ cm}$ ,  $m\angle M = 58^\circ$ ,  $m\angle O = 105^\circ$ ,  $m\angle R = 90^\circ$ .

(2) Construct  $\square$  DEFG such that  $l(DE) = 4.5 \text{ cm}$ ,  $l(EF) = 6.5 \text{ cm}$ ,  $l(DG) = 5.5 \text{ cm}$ ,  $l(DF) = 7.2 \text{ cm}$ ,  $l(EG) = 7.8 \text{ cm}$ .

(3) In  $\square$  ABCD,  $l(AB) = 6.4 \text{ cm}$ ,  $l(BC) = 4.8 \text{ cm}$ ,  $m\angle A = 70^\circ$ ,  $m\angle B = 50^\circ$ ,  $m\angle C = 140^\circ$ .

(4) Construct  $\square$  LMNO such that  $l(LM) = l(LO) = 6 \text{ cm}$ ,  $l(ON) = l(NM) = 4.5 \text{ cm}$ ,  $l(OM) = 7.5 \text{ cm}$ .

**Solution:**

(1) In  $\square$  MORE,  $l(MO) = 5.8 \text{ cm}$ ,  $l(OR) = 4.4 \text{ cm}$ ,  $m\angle M = 58^\circ$ ,  $m\angle O = 105^\circ$ ,  $m\angle R = 90^\circ$ .

Steps to construct a quadrilateral:

Step 1: Draw a line MO = 5.8cm.

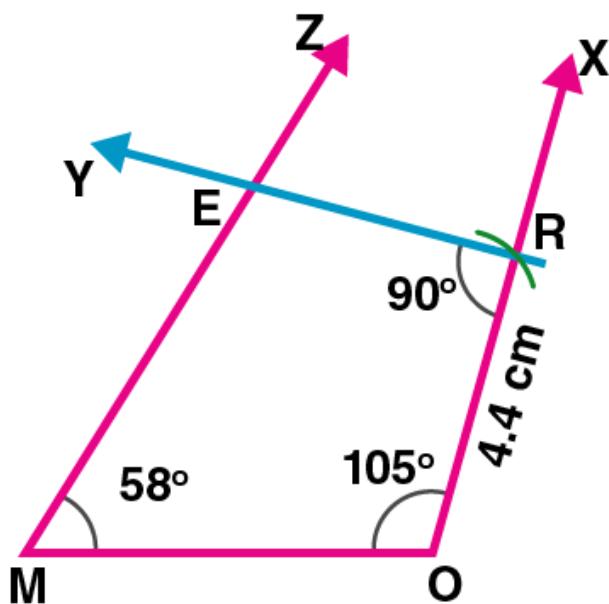

Step 2: At point O, construct an angle of  $105^\circ$ . Such that it forms a line OX.

Step 3: At point M, construct an angle of  $58^\circ$ . Such that it forms a line MZ.

Step 4: With O as the centre and of radius 4.4cm, cut an arc on the line OX and mark that point as R.

Step 5: Now, at point R construct an angle of  $90^\circ$ . Such that it forms a line RY and the point E is formed intersecting on the line MZ.

Here, is the required MORE quadrilateral.

- (2) Construct  $\square$  DEFG such that  $l(DE) = 4.5 \text{ cm}$ ,  $l(EF) = 6.5 \text{ cm}$ ,  $l(DG) = 5.5 \text{ cm}$ ,  $l(DF) = 7.2 \text{ cm}$ ,  $l(EG) = 7.8 \text{ cm}$ .

Steps to construct a quadrilateral:

Step 1: Draw a line  $DE = 4.5 \text{ cm}$ .

Step 2: With D as the centre and radius  $7.2 \text{ cm}$ , draw an arc.

Step 3: With E as the centre and radius  $6.5 \text{ cm}$ , draw an arc cutting the previous arc at F.

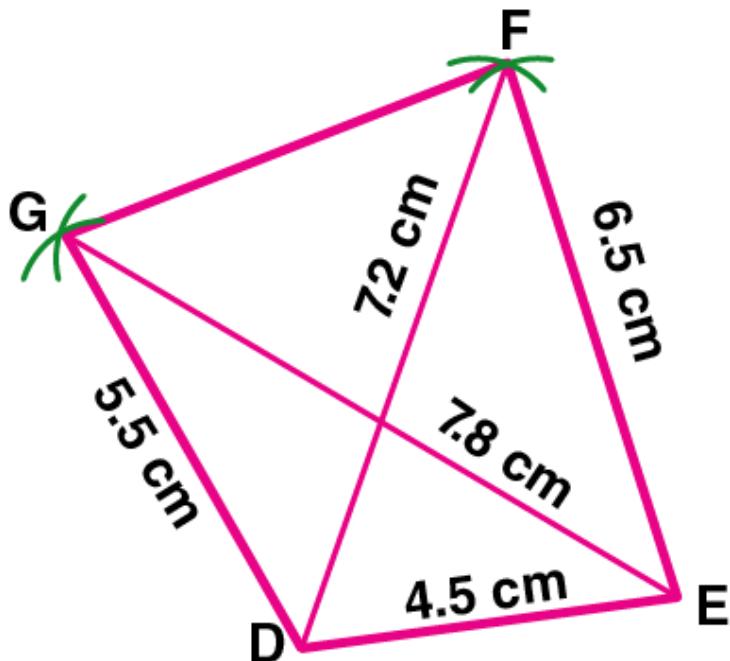

Step 4: Join EF and DF.

Step 5: With D as the centre and radius  $5.5 \text{ cm}$ , draw an arc.

Step 6: With E as the centre and radius  $7.8 \text{ cm}$ , draw an arc cutting the previous arc at G.

Step 7: Join DG, EG and GF.

Here, is the required DEFG quadrilateral.

- (3) In  $\square ABCD$ ,  $l(AB) = 6.4 \text{ cm}$ ,  $l(BC) = 4.8 \text{ cm}$ ,  $m\angle A = 70^\circ$ ,  $m\angle B = 50^\circ$ ,  $m\angle C = 140^\circ$ .

Steps to construct a quadrilateral:

Step 1: Draw a line  $AB = 6.4 \text{ cm}$ .

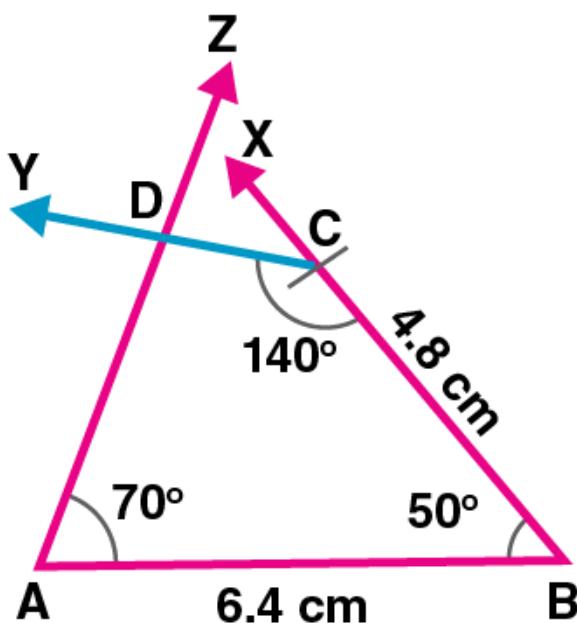

Step 2: construct an angle at point B of  $50^\circ$

Step 3: With B as the centre and radius of  $4.8 \text{ cm}$ , draw an arc cutting the line BX at point C.

Step 4: construct an angle of  $140^\circ$  at point C and name that line as Y.

Step 5: construct an angle of  $70^\circ$  at point A, such that line AZ and line CY intersect at point D.

Here, is the required ABCD quadrilateral.

- (4) Construct  $\square$  LMNO such that  $l(LM) = l(LO) = 6 \text{ cm}$ ,  $l(ON) = l(NM) = 4.5 \text{ cm}$ ,  $l(OM) = 7.5 \text{ cm}$ .

Steps to construct a quadrilateral:

Step 1: Draw a line  $LM = 6\text{cm}$ .

Step 2: With L as the centre and radius 6cm, draw an arc.

Step 3: With M as the centre and radius 7.5cm, draw an arc cutting the previous arc at O.

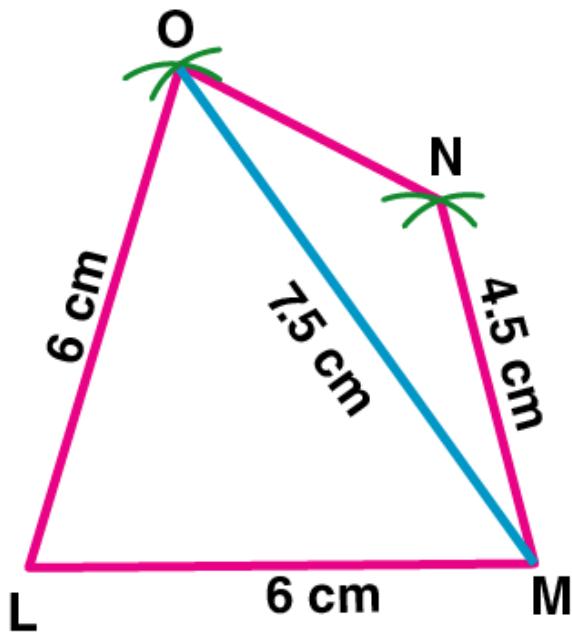

Step 4: Join OL and OL.

Step 5: With O as the centre and radius 4.5cm, draw an arc.

Step 6: With M as the centre and radius 4.5cm, draw an arc cutting the previous ac at N.

Step 7: Join ON, MN and OL.

Here, is the required LMNO quadrilateral.

**PRACTICE SET 8.2**
**PAGE NO: 46**

**1. Draw a rectangle ABCD such that  $l(AB) = 6.0\text{ cm}$  and  $l(BC) = 4.5\text{ cm}$ .**

**Solution:**

Steps to construct a rectangle:

Step 1: Draw a line AB = 6cm.

Step 2: Construct an angle of  $90^\circ$  at point B.

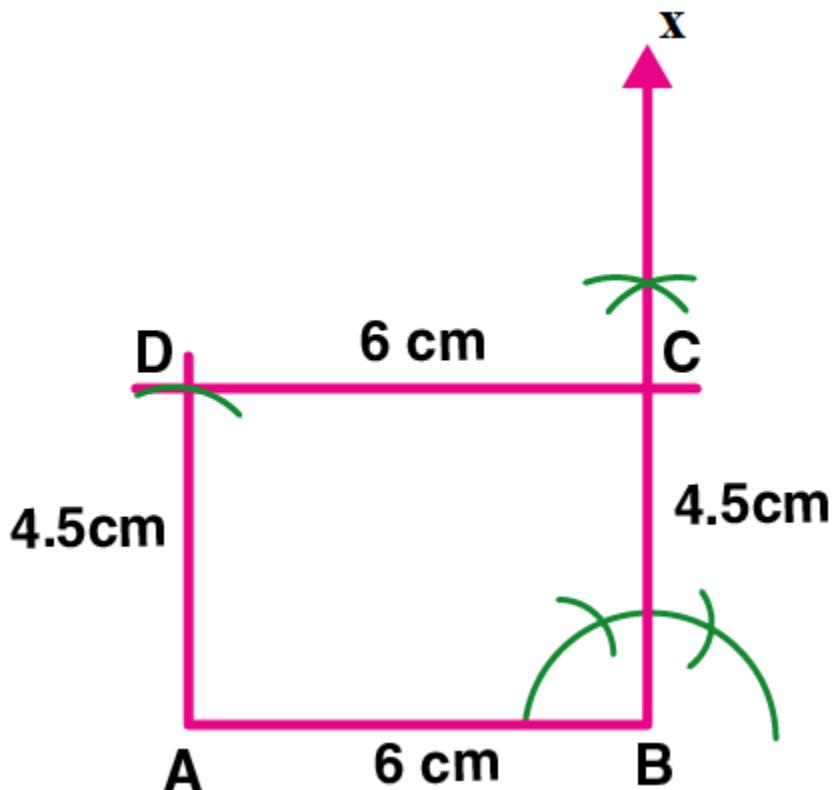

Step 3: With B as centre and radius 4.5cm, draw an arc cutting the line BX at point C.

Step 4: With C as centre and radius 6cm, draw an arc.

Step 5: With A as the centre and radius 4.5cm, draw an arc cutting the previous arc at point D.

Step 6: Join AD and CD.

Here, is the required ABCD rectangle.

**2. Draw a square WXYZ with side 5.2 cm.**

**Solution:**

Steps to construct a square:

Step 1: Draw a line WX = 5.2cm.

Step 2: Construct an angle of  $90^\circ$  at point X.

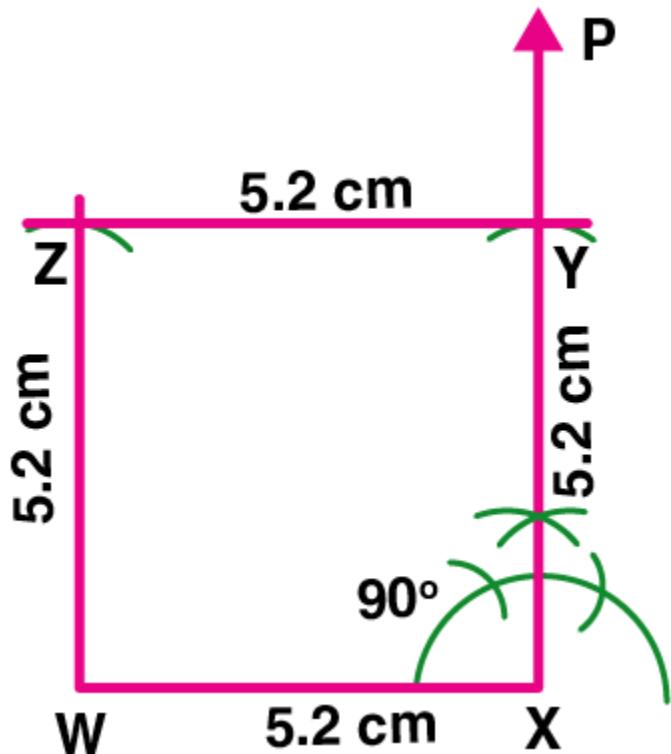

Step 3: With X as centre and radius 5.2cm, draw an arc cutting the line XP at point Y.

Step 4: With Y as centre and radius 5.2cm, draw an arc.

Step 5: With W as the centre and radius 5.2cm, draw an arc cutting the previous arc at point Z.

Step 6: Join YZ and WZ.

Here, is the required WXYZ square.

**3. Draw a rhombus KLMN such that its side is 4 cm and  $m\angle K = 75^\circ$ .**

**Solution:**

Steps to construct a rhombus:

Step 1: Draw a line KL = 4cm.

Step 2: Construct an angle of  $75^\circ$  at point K.

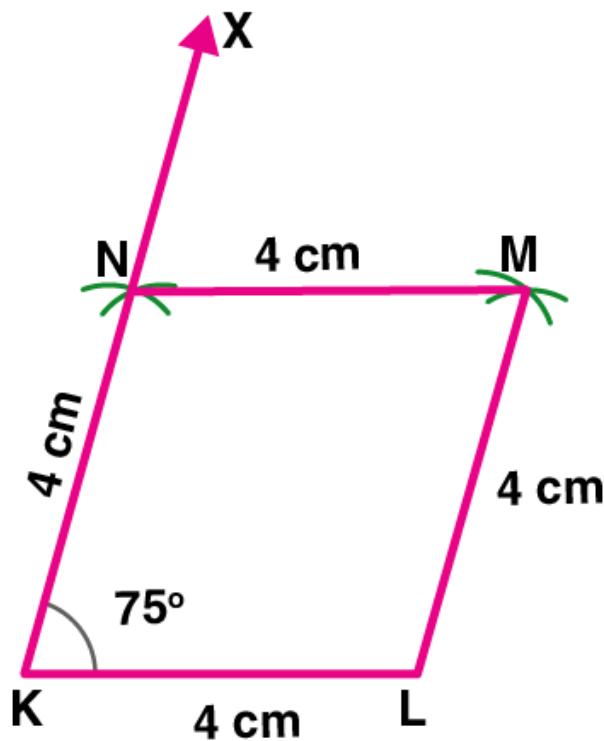

Step 3: With K as centre and radius 4cm, draw an arc cutting the line KX at point N.

Step 4: With N as centre and radius 4cm, draw an arc.

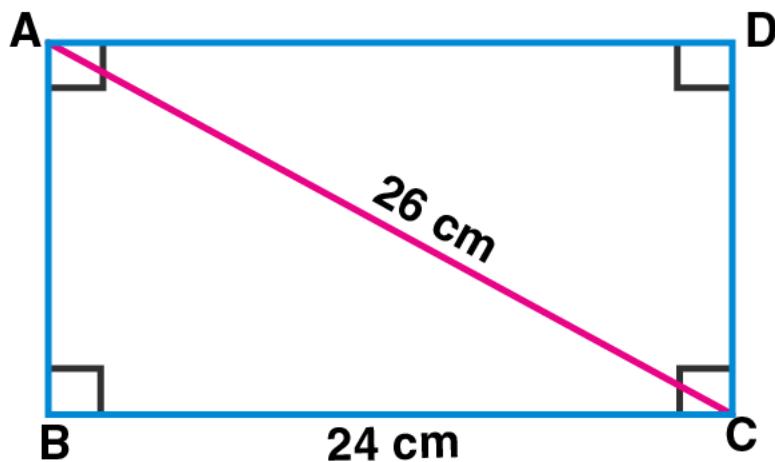

Step 5: With L as the centre and radius 4cm, draw an arc cutting the previous arc at point M.

Step 6: Join LM and NM.

Here, is the required KLMN rhombus.

4. If diagonal of a rectangle is 26 cm and one side is 24 cm, find the other side.  
 Solution:

Let ABCD be the rectangle.

$$l(BC) = 24\text{cm}, l(AC) = 26\text{cm}$$

In  $\triangle ABC$ ,

$$m\angle ABC = 90^\circ \text{ [Angle of a rectangle]}$$

By using Pythagoras theorem,

$$[l(AC)]^2 = [l(AB)]^2 + [l(BC)]^2$$

$$(26)^2 = [l(AB)]^2 + (24)^2$$

$$(26)^2 - (24)^2 = [l(AB)]^2$$

$$(26 + 24)(26 - 24) = [l(AB)]^2 \text{ [Since, } a^2 - b^2 = (a + b)(a - b)]$$

$$50 \times 2 = [l(AB)]^2$$

$$100 = [l(AB)]^2$$

$$l(AB) = \sqrt{100}$$

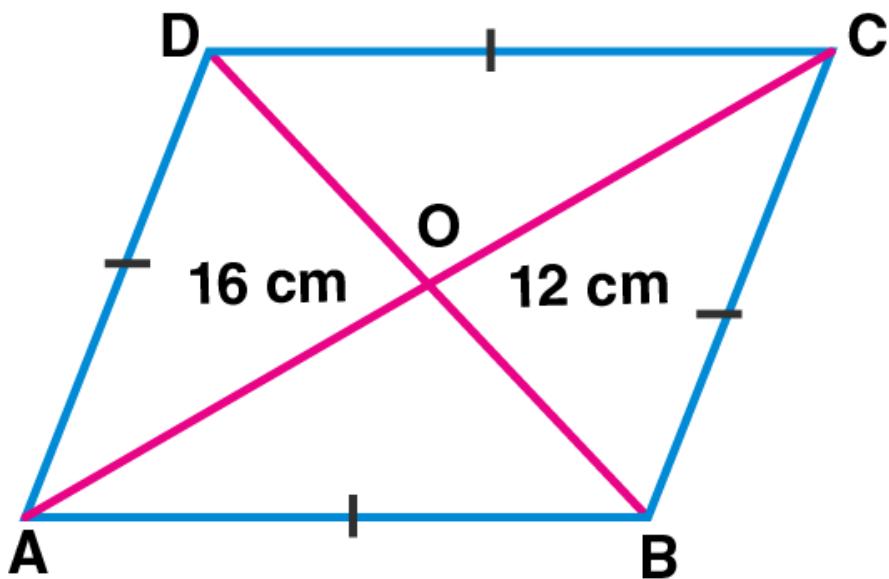

By taking square root of both sides, we get

$$l(AB) = 10 \text{ cm}$$

∴ The length of the other side is 10 cm.

**5. Lengths of diagonals of a rhombus ABCD are 16 cm and 12 cm. Find the side and perimeter of the rhombus.**

**Solution:**

In rhombus ABCD,

It is given that,  $l(AC) = 16 \text{ cm}$  and  $l(BD) = 12 \text{ cm}$ .

Let the diagonals of rhombus ABCD intersect at point O.

$l(AO) = \frac{1}{2} l(AC)$  [Diagonals of a rhombus bisect each other]

$$\begin{aligned} l(AO) &= \frac{1}{2} \times 16 \\ &= 8 \text{ cm} \end{aligned}$$

Also,  $l(DO) = \frac{1}{2} l(BD)$  [Diagonals of a rhombus bisect each other]

$$l(DO) = \frac{1}{2} \times 12$$

$$l(DO) = 6 \text{ cm}$$

In  $\triangle DOA$ ,

$m\angle DOA = 90^\circ$  [Diagonals of a rhombus are perpendicular to each other]

By using Pythagoras theorem,

$$\begin{aligned}[l](AD)]^2 &= [l(AO)]^2 + [l(DO)]^2 \\&= (8)^2 + (6)^2 \\&= 64 + 36\end{aligned}$$

$$[l(AD)]^2 = 100$$

$$l(AD) = \sqrt{100}$$

By taking square root on both sides, we get

$$l(AD) = 10 \text{ cm}$$

$l(AB) = l(BC) = l(CD) = l(AD) = 10 \text{ cm}$  [Since, sides of a rhombus are congruent]

Perimeter of rhombus ABCD

$$= l(AB) + l(BC) + l(CD) + l(AD)$$

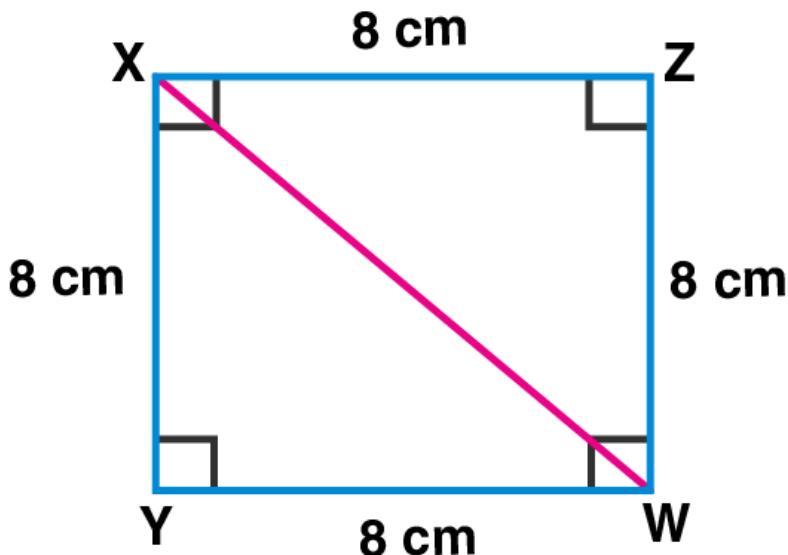

$$= 10+10+10+10$$

$$= 40 \text{ cm}$$

$\therefore$  The side and perimeter of the rhombus are 10 cm and 40 cm respectively.

### 6. Find the length of diagonal of a square with side 8 cm.

**Solution:**

Let XYWZ be the square of side 8cm.

seg XW is a diagonal.

In  $\triangle XYW$ ,

$m\angle XYW = 90^\circ$  [Angle of a square]

By using Pythagoras theorem,

$$\begin{aligned}[l(XW)]^2 &= [l(XY)]^2 + [l(YW)]^2 \\&= (8)^2 + (8)^2 \\&= 64 + 64\end{aligned}$$

$$[l(XW)]^2 = 128$$

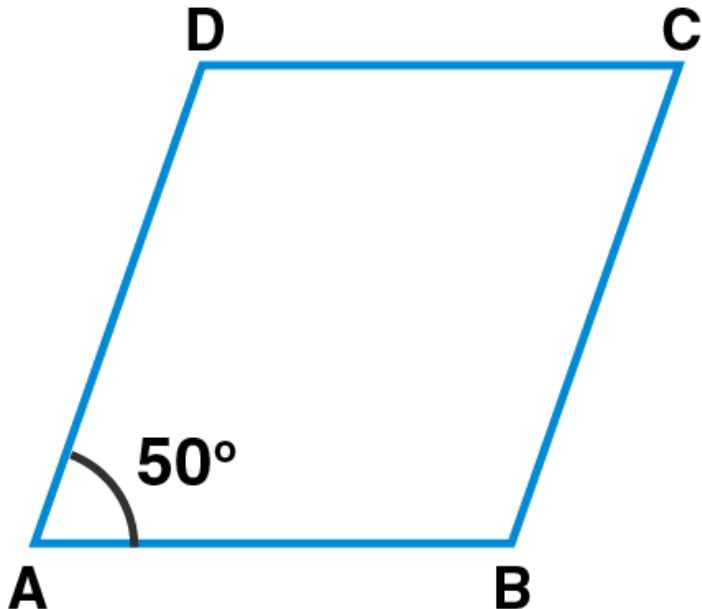

By taking square root on both sides, we get

$$\begin{aligned}l(XW) &= \sqrt{128} \\&= \sqrt{64 \times 2} \\&= 8\sqrt{2} \text{ cm}\end{aligned}$$

$\therefore$  The length of the diagonal of the square is  $8\sqrt{2}$  cm.

**7. Measure of one angle of a rhombus is  $50^\circ$ , find the measures of remaining three angles.**

**Solution:**

Let ABCD be the rhombus.

$$m\angle A = 50^\circ$$

$m\angle C = m\angle A$  [Since, opposite angles of a rhombus are congruent]

$$\therefore m\angle C = 50^\circ$$

Also,  $m\angle D = m\angle B$  ...(i) [Opposite angles of a rhombus are congruent]

In rhombus ABCD, we know that sum of the measures of the angles of a quadrilateral is  $360^\circ$ .

$$m\angle A + m\angle B + m\angle C + m\angle D = 360^\circ$$

$$50^\circ + m\angle B + 50^\circ + m\angle D = 360^\circ$$

$$m\angle B + m\angle D + 100^\circ = 360^\circ$$

$$m\angle B + m\angle D = 360^\circ - 100^\circ$$

$$m\angle B + m\angle B = 260^\circ \text{ [From (i)]}$$

$$2m\angle B = 260^\circ$$

$$m\angle B = 260/2$$

$$m\angle B = 130^\circ$$

$$m\angle D = m\angle B = 130^\circ \text{ [From (i)]}$$

∴ The measures of the remaining angles of the rhombus are  $130^\circ$ ,  $50^\circ$  and  $130^\circ$ .

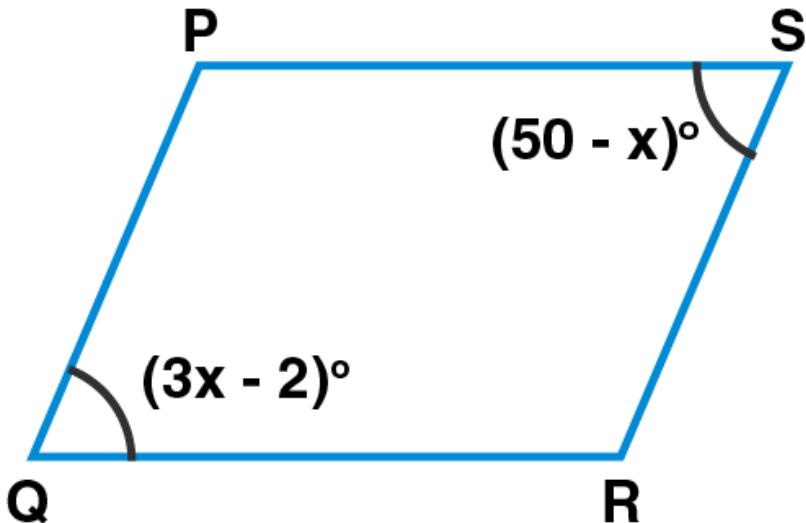

**PRACTICE SET 8.3**
**PAGE NO: 49**

- 1. Measures of opposite angles of a parallelogram are  $(3x - 2)^\circ$  and  $(50 - x)^\circ$ . Find the measure of its each angle.**

**Solution:**

Let PQRS be the parallelogram.

$$m\angle Q = (3x - 2)^\circ \text{ and } m\angle S = (50 - x)^\circ$$

$m\angle Q = m\angle S$  .....(i) [Since, opposite angles of a parallelogram are congruent]

$$3x - 2 = 50 - x$$

$$3x + x = 50 + 2$$

$$4x = 52$$

$$x = 52/4$$

$$x = 13$$

Now,  $m\angle Q = (3x - 2)^\circ$

$$(3 \times 13 - 2)^\circ = (39 - 2)^\circ = 37^\circ$$

$m\angle S = m\angle Q = 37^\circ$  [From(i)]

$m\angle P + m\angle Q = 180^\circ$  [Since, adjacent angles of a parallelogram are supplementary]

$$m\angle P + 37^\circ = 180^\circ$$

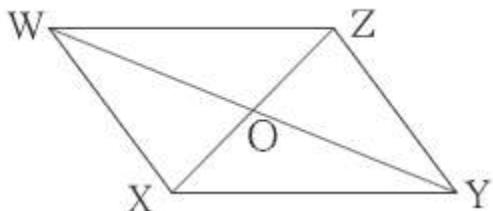

$$m\angle P = 180^\circ - 37^\circ = 143^\circ$$

$m\angle R = m\angle P = 143^\circ$  [Since, opposite angles of a parallelogram are congruent]

∴ The measures of the angles of the parallelogram are  $37^\circ$ ,  $143^\circ$ ,  $37^\circ$  and  $143^\circ$ .

- 2. Referring the given figure of a parallelogram, write the answers of questions given below.**

- (1) If  $l(WZ) = 4.5 \text{ cm}$ , then  $l(XY) = ?$
- (2) If  $l(YZ) = 8.2 \text{ cm}$ , then  $l(XW) = ?$
- (3) If  $l(OX) = 2.5 \text{ cm}$ , then  $l(OZ) = ?$
- (4) If  $l(WO) = 3.3 \text{ cm}$ , then  $l(WY) = ?$
- (5) If  $m\angle WZY = 120^\circ$ , then  $m\angle WXY = ?$  and  $m\angle XWZ = ?$

**Solution:**

(1) It is given that,  $l(WZ) = 4.5 \text{ cm}$   
 $l(XY) = l(WZ)$  [Since, opposite sides of a parallelogram are congruent]  
 $\therefore l(XY) = 4.5 \text{ cm}$

(2) It is given that,  $l(YZ) = 8.2 \text{ cm}$   
 $l(XW) = l(YZ)$  [Since, opposite sides of a parallelogram are congruent]  
 $\therefore l(XW) = 8.2 \text{ cm}$

(3) It is given that,  $l(OX) = 2.5 \text{ cm}$   
 $l(OZ) = l(OX)$  [Since, diagonals of a parallelogram bisect each other]  
 $\therefore l(OZ) = 2.5 \text{ cm}$

(4) It is given that,  $l(WO) = 3.3 \text{ cm}$   
 $l(WO) = 1/2 l(WY)$  [Since, diagonals of a parallelogram bisect each other]  
 $3.3 = 1/2 l(WY)$   
 $3.3 \times 2 = l(WY)$   
 $\therefore l(WY) = 6.6 \text{ cm}$

(5) It is given that,  $m\angle WZY = 120^\circ$   
 $m\angle WXY = m\angle WZY$  [Since, opposite angles of a parallelogram are congruent]  
So,  $m\angle WXY = 120^\circ$

Now,

$m\angle XWZ + m\angle WXY = 180^\circ$  [Since, adjacent angles of a parallelogram are supplementary]  
 $m\angle XWZ + 120^\circ = 180^\circ$   
 $m\angle XWZ = 180^\circ - 120^\circ$   
 $\therefore m\angle XWZ = 60^\circ$

**3. Construct a parallelogram ABCD such that  $l(BC) = 7 \text{ cm}$ ,  $m\angle ABC = 40^\circ$ ,  $l(AB) = 3 \text{ cm}$ .**

**Solution:**

Steps to construct:

Step 1: Draw a line AB = 3cm.

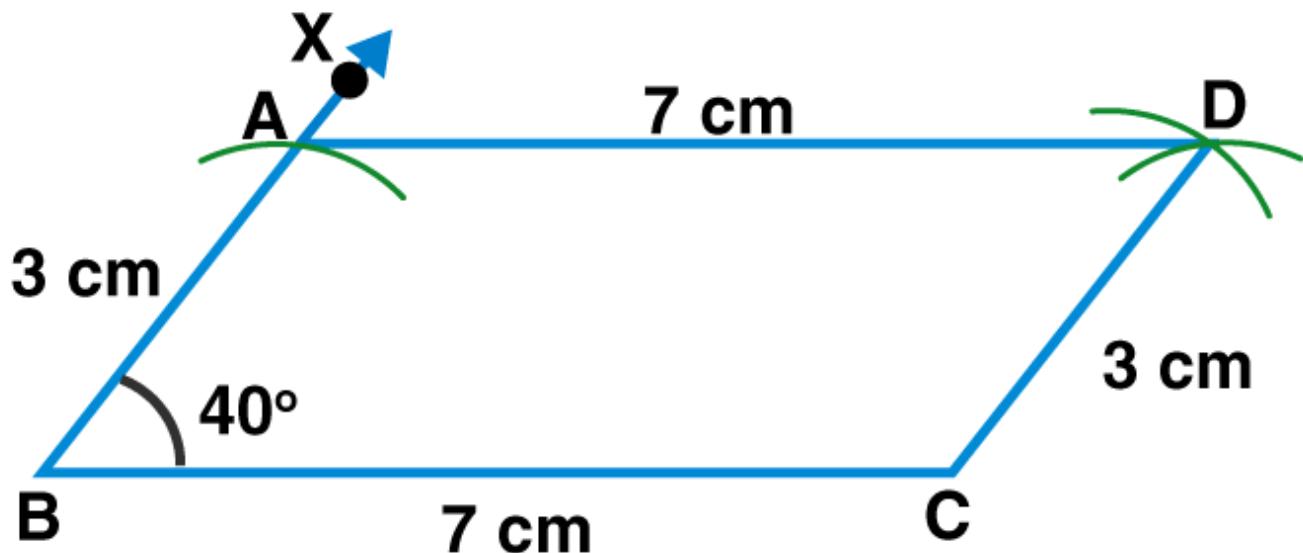

Step 2: Construct an angle of  $40^\circ$  at point B.

Step 3: With B as centre and radius 7cm, draw an arc cutting the line BX at point C.

Step 4: With C as centre and radius 3cm, draw an arc.

Step 5: With A as the centre and radius 7cm, draw an arc cutting the previous arc at point D.

Step 6: Join AD and CD.

Opposite sides of a parallelogram are congruent.

$$\therefore l(AB) = l(CD) = 3 \text{ cm}$$

$$l(BC) = l(AD) = 7 \text{ cm}$$

**4. Ratio of consecutive angles of a quadrilateral is 1: 2: 3: 4. Find the measure of its each angle. Write with reason, what type of a quadrilateral it is.**

**Solution:**

Let PQRS be the quadrilateral.

Ratio of consecutive angles of a quadrilateral is 1: 2: 3: 4.

Let us consider 'x' be the common multiple.

$$\therefore m\angle P = x^\circ, m\angle Q = 2x^\circ, m\angle R = 3x^\circ \text{ and } m\angle S = 4x^\circ$$

In quadrilateral PQRS,

$m\angle P + m\angle Q + m\angle R + m\angle S = 360^\circ$  [Sum of the measures of the angles of a quadrilateral is  $360^\circ$ ]

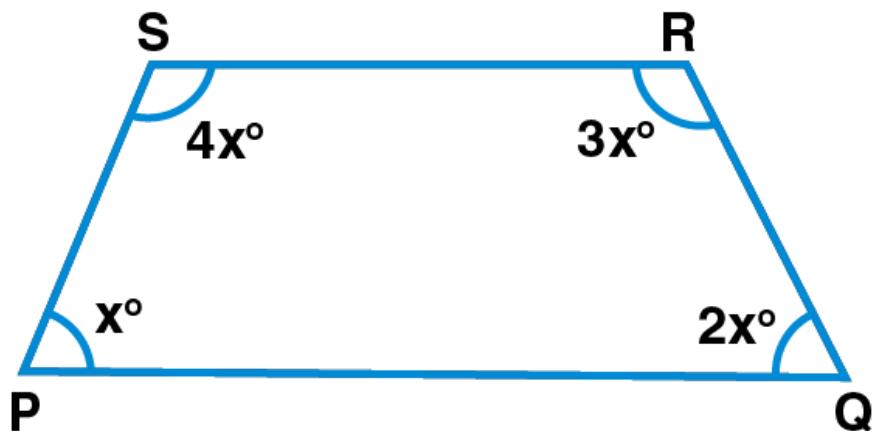

$$x^\circ + 2x^\circ + 3x^\circ + 4x^\circ = 360^\circ$$

$$10x^\circ = 360^\circ$$

$$x^\circ = 360/10$$

$$x^\circ = 36^\circ$$

$$\therefore m\angle P = x^\circ = 36^\circ$$

$$m\angle Q = 2x^\circ = 2 \times 36^\circ = 72^\circ$$

$$m\angle R = 3x^\circ = 3 \times 36^\circ = 108^\circ \text{ and}$$

$$m\angle S = 4x^\circ = 4 \times 36^\circ = 144^\circ$$

$\therefore$  The measures of the angles of the quadrilateral are  $36^\circ, 72^\circ, 108^\circ, 144^\circ$ .

$$\text{Here, } m\angle P + m\angle S = 36^\circ + 144^\circ = 180^\circ$$

side PQ  $\parallel$  side SR [Since, interior angles are supplementary]

$$m\angle P + m\angle Q = 36^\circ + 72^\circ$$

$$= 108^\circ$$

$$\neq 180^\circ$$

So, side PS is not parallel to side QR.

Since, one pair of opposite sides of the given quadrilateral is parallel.

$\therefore$  The given quadrilateral is a trapezium.

**5. Construct  $\square$  BARC such that  $l(BA) = l(BC) = 4.2$  cm,  $l(AC) = 6.0$  cm,  $l(AR) = l(CR) = 5.6$  cm.**

**Solution:**

Steps to construct:

Step 1: Draw a line BA = 4.2cm.

Step 2: With B as the centre and radius 4.2cm, draw an arc.

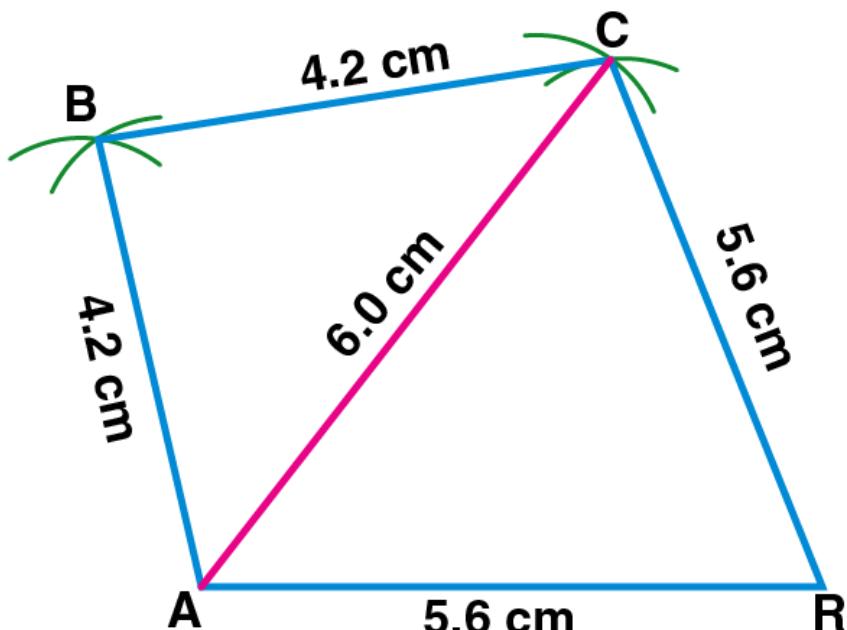

Step 3: With A as the centre and radius 6cm, draw an arc cutting the previous arc at C.

Step 4: Join BC and AC.

Step 5: With A as the centre and radius 5.6cm, draw an arc.

Step 6: With C as the centre and radius 5.6cm, draw an arc cutting the previous ac at D.

Step 7: Join AD, CD and BC.

6. Construct  $\square$  PQRS, such that  $l(PQ) = 3.5$  cm,  $l(QR) = 5.6$  cm,  $l(RS) = 3.5$  cm,  $m\angle Q = 110^\circ$ ,  $m\angle R = 70^\circ$ .

If it is given that  $\square$  PQRS is a parallelogram, which of the given information is unnecessary?

**Solution:**

Steps to construct:

Step 1: Draw a line PQ = 3.5cm.

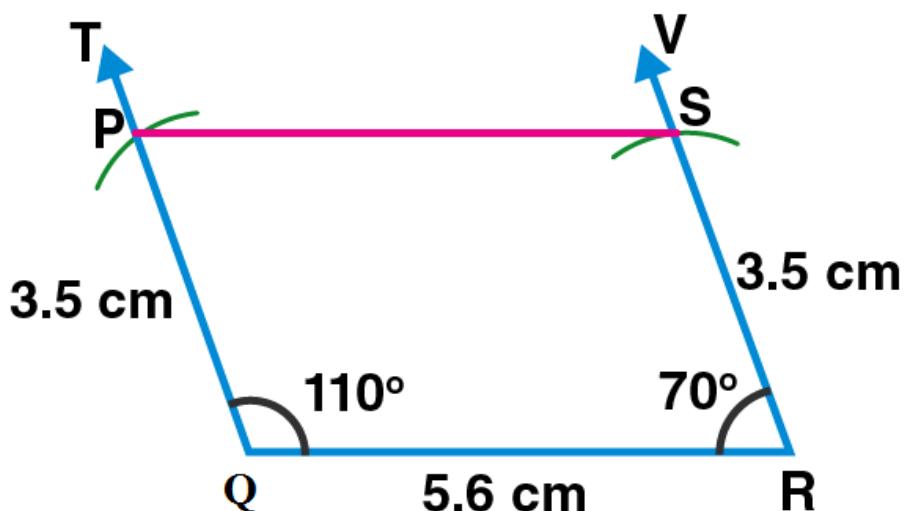

Step 2: Construct an angle of  $110^\circ$  at point Q.

Step 3: With Q as centre and radius 5.6cm, draw an arc cutting the line QX at point R.

Step 4: Construct an angle of  $70^\circ$  at point R.

Step 5: With R as the centre and radius 3.5cm, draw an arc cutting the Line RY at point S.

Step 6: Join RS and PS.

- Since, the opposite sides of a parallelogram are congruent.  
Either  $l(PQ)$  or  $l(SR)$  is required.
- To construct a parallelogram, length of adjacent sides and measure of one angle is required.  
Either  $l(PQ)$  and  $m\angle Q$  or  $l(SR)$  and  $m\angle R$  is the unnecessary information given in the question.
