18. Decreases

19. \[ \frac{R_2}{R_1} = \left( \frac{A_2}{A_1} \right)^\frac{1}{3} \Rightarrow R_2 = 3.6 \left( \frac{64}{27} \right)^\frac{1}{3} = 3.6 \times \frac{4}{3} = 4.3 \text{ Fermi} \]

OR

\[ \frac{\lambda_p}{\lambda_e} = \frac{m_p v_p}{m_e v_e} = \frac{1.67 \times 10^{-27}}{9.1 \times 10^{-31}} = 1.8 \times 10^{23} \]

20. Conduction current is established by actual movement of free electrons through a metallic conductor while displacement current is established by polarization of molecules of a dielectric under the influence of an external electric field. Displacement current is produced by time varying electric flux and electric field across the dielectric medium between capacitor plates that leads to polarization and displacement of charges.

SECTION – B

21. \[ B_p = B_A + B_B = \frac{I}{2\pi x} \text{ (upwards)} + \frac{\mu_0 I}{2\pi (d-x)} \text{ (down)} \]

\[ = \frac{\mu_0 I}{2\pi} \left[ \frac{1}{x} - \frac{1}{d-x} \right] \]

\[ = \frac{\mu_0 I}{2\pi} \left[ \frac{d-x-x}{x(d-x)} \right] = \frac{\mu_0 I}{2\pi} \left( \frac{d-2x}{x(d-x)} \right) \text{ upwards} + \frac{\mu_0 I}{2\pi (d-x)} \text{ (down)} \]

\[
\frac{m v_p r_n}{m v_e r_n} = \left( \frac{z e^2}{4 \pi \varepsilon_0} \right) \left[ \frac{2\pi}{nh} \right]
\]
22. \[ m = \text{mass of } e^- \]

Centripetal force = Electrostatic required by \( e^- \) attraction to resolve nucleus

\[ \Rightarrow \frac{mv_n^2}{r_n} = \frac{1}{4\pi\varepsilon_0} \left( \frac{Ze}{r_n^2} \right)^2 \Rightarrow mv_n^2r_n = \frac{e^2}{4\pi\varepsilon_0} \quad [z = 1] \quad (i) \]

By Bohr's II postulate,

Angular momentum of \( e^- = mv_n r_n = \frac{nh}{2\pi} \) \quad (ii)

From (ii) \( v_n = \frac{nh}{2\pi mr_n} \) substituting in (i)

\[ \Rightarrow mr_n \frac{n^2h^2}{4\pi^2m^2r_n^2} = \frac{e^2}{4\pi\varepsilon_0} \]
23. Wavefront: It is a locus of all the disturbances oscillating with energy in same phase at a given instant.

A plane wavefront AB is incident in rarer medium at instant \( t = 0 \) on interface XY separating it from a denser medium. When wavelet A is on interface, B is at a distance BB, from it. It takes \( t \) time to cover the distance \( BB = v_B t \) to reach on interface XY. Meanwhile, the wavelet from A reaches to point A1 covering a distance \( AA_1 = v_1 t \) in denser medium.
To locate $A_1$, draw a secondary wavelet with radius $AA_1 = v_2 t$ & centre A. Draw tangent from B, onto this sec. wavelet intersecting at $A_1$.

$A_1B_1$ is refracted wavefront at instant $t$.

$i = \text{angle of incidence}$

$r = \text{angle of refraction}$.

$\therefore \triangle ABB_1 \Rightarrow \sin i = \frac{BB_1}{AB_1}$

$\triangle AA_1B_1 \Rightarrow \sin r = \frac{AA_1}{AB_1}$

$\therefore \frac{\sin i}{\sin r} = \frac{BB_1}{AA_1} = \frac{v_1}{v_2}$

$\therefore \frac{\sin i}{\sin r} = \frac{v_1}{v_2} = \text{constant}$

Which is Snell's law.

OR

Ace to lens maker's formula

$$\frac{1}{v} - \frac{1}{u} = (n_{21} - 1) \left( \frac{1}{R_1} - \frac{1}{R_2} \right) \quad \ldots \ (1)$$

When object is at placed at infinity,

$u = \infty$

Image is obtained at focus

$v = f$

Using these values in Eq (1)

$$\frac{1}{f} - \frac{1}{\infty} = (n_{21} - 1) \left( \frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\Rightarrow \frac{1}{f} = (n_{21} - 1) \left( \frac{1}{R_1} - \frac{1}{R_2} \right) \quad \ldots \ (2)$$

$\therefore \text{By Eq (1) & (2)} \Rightarrow \frac{1}{f} = \frac{1}{v} - \frac{1}{u}$
Depletion layer: It is a layer of immobile ions formed near the p-n junction by diffusion of majority charge carriers and electron-hole recombination.

Potential barrier: It is the potential difference developed across the junction when diffusion current & drift current attains equilibrium across the junction.

(a) When forward biased, width of depletion layer decreases.
(b) And value of barrier potential also reduces as $v_0 - v$.

24. Meter bridge works on the condition of balanced wheatstone bridge condition.

\[ X = Y \frac{l}{100-l} \]

25. Depletion layer: It is a layer of immobile ions formed near the p-n junction by diffusion of majority charge carriers and electron-hole recombination.

Potential barrier: It is the potential difference developed across the junction when diffusion current & drift current attains equilibrium across the junction.

(a) When forward biased, width of depletion layer decreases.
(b) And value of barrier potential also reduces as $v_0 - v$. 
26. \( q_{\text{new}} = Nq \); \( q \) = charge on each small droplet

\[
\frac{4}{3} \pi R^3 = N \left( \frac{4}{3} \pi r^3 \right) \Rightarrow R = N^{1/3} r
\]

\( R \) = radius of larger drop

\( \therefore V = \frac{kq}{r} \) = potential on each small dropper.

\( \therefore V' \) = Potential on large drop

\[
\frac{kq_{\text{new}}}{R} = \frac{K(Nq)}{N^{1/3} r} = N^{2/3} \left( \frac{kq}{r} \right)
\]

\( \Rightarrow V' = N^{2/3} V \)

27. Activity \( \rightarrow \) If is defined as the number of atoms decaying per unit time at a given instant.

\[
\lambda = 0.0693 h^{-1} \Rightarrow T_{1/2} = \frac{0.693}{0.0693} = 10 \text{ hr}
\]

\[
\frac{R}{R_0} = \left( \frac{1}{2} \right)^n \Rightarrow \left( \frac{R_{1/2}}{R_0} \right) = \left( \frac{1}{2} \right)^{1/10}
\]

\( \Rightarrow \frac{1}{2} = \left( \frac{1}{2} \right)^{1/10} \Rightarrow \frac{t}{10} = 1 \Rightarrow t = 10 \text{ hr} \)

SECTION – C

28. (a)
29. When solar radiations are incident near the depletion layer of solar cell, covalent bonds break absorbing the photons to create $e^-$ hole pairs and following three important process occur.

(i) Generation of $e^-$ hole pair by breaking of covalent bonds absorbing radiations incident on depletion layer when $h\nu > E_g$.

(ii) separation of $e^-$ and hole in n-side and holes in p-side to develop a photovoltage $V_{oc}$ across the solar cell.

(iii) Collection of electrons reaching the n-side by the front contact and holes reaching the p-side by the back contact.

I-V characteristics

Thus the p-side become positive and the n-side becomes negative giving rise to photo voltage.
30. (a) Peak value of voltage drop across

(i) \( R \Rightarrow V_R = I_0 R = \frac{V_0 R}{\sqrt{R^2 + X_L^2}} \)

(ii) \( L \Rightarrow V_L = I_0 X_C = \frac{V_0 X_C}{\sqrt{R^2 + X_L^2}} \)

Phase difference between \( V \) & \( I \) is \( \phi = \tan^{-1}\left(\frac{V_L}{V_R}\right) = \tan^{-1}\left(\frac{X_L}{R}\right) \)

31. (a) \( v = \frac{1}{\sqrt{\mu_0 \mu, \varepsilon_0 \varepsilon_r}} = \frac{c}{\sqrt{\mu, \varepsilon_r}} \)
(b) 
(i) Microwaves \(10^{-1} \text{ to } 10^{-4} m = \lambda\)
(ii) Infrared \(10^{-4} \text{ to } 10^{-6} m = \lambda\)
\((> 700 \text{nm})\)

32. 
(a) 
Potential difference across A & B

\[ V = V_A - V_B = E_1 - I_1r_1 \]  \( \cdots \) (1)

\[ V = V_A - V_B = E_2 - I_2r_2 \]  \( \cdots \) (2)

\[ I_1 = \frac{E_1}{r_1} - \frac{V}{r_1} \]  \( \cdots \) (3) (from (1))

\[ I_2 = \frac{E_2}{r_2} - \frac{V}{r_2} \]  \( \cdots \) (4) (from (2))

For Equivalent cell

\[ I = \frac{E}{r} - \frac{V}{r} \]  \( \cdots \) (5)

\[ I = I_1 + I_2 \]

\[ \therefore \frac{E}{r} - \frac{V}{r} = \left( \frac{E_1}{r_1} - \frac{V}{r_1} \right) + \left( \frac{E_2}{r_2} - \frac{V}{r_2} \right) \]

\[ = \left( \frac{E_1}{r_1} + \frac{E_2}{r_2} \right) - V \left( \frac{1}{r_1} + \frac{1}{r_2} \right) \]

Comparing we get

\[ \frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2} \]

\[ \therefore \text{Equivalent internal resistance is} \]
\[ r = \frac{r_1 r_2}{r_1 + r_2} \]

Also
\[ \frac{E}{r} = \frac{E_1}{r_1} + \frac{E_2}{r_2} = \frac{E_1 r_2 + E_2 r_1}{r_1 r_2} \]

\[ \therefore \] Equivalent emf is
\[ E = \frac{E_1 r_2 + E_2 r_1}{r_1 + r_2} \]

(b)
\[ E = \frac{5 \times 2 + 5 \times 2}{2 + 2} = 5 \text{ V} \]
\[ r = \frac{2 \times 2}{2 + 2} = 1 \text{r} \]
\[ I = \frac{E}{R + r} = \frac{5}{10 + 1} = \frac{5}{11} \text{ A} \]

\[ \therefore \text{Voltage across } R \Rightarrow V = IR = \frac{5}{11} \times 10 = \frac{50}{11} \text{ V} = 4.54 \text{ V} \]

33. (a) Magnetic moment \( \vec{M} = Ni \left( \pi r^2 \right) \hat{n} \)

(b)

Magnetic field at point P(x, 0, 0) due to \( I \text{dl} \)
\[ dB = \frac{\mu_0}{4\pi} \frac{I \text{dl} \sin 90^\circ}{r_1^2} \text{ along PQ} \]
For entire coil \( \int dB \cos \theta = 0 \)

\[ B \text{ at } P \Rightarrow B = \int dB \sin \theta = \frac{\mu_0 I}{4\pi R^2} \int_0^{2\pi} dl \]

\[ = \frac{\mu_0 I}{4\pi r_1^2} \times \frac{r}{r_1} \times (2\pi r) \]

\[ \Rightarrow B = \frac{\mu_0 I r^2}{2\left(r^2 + x^2\right)^2} \]

Coil has \( N \) turns then

\[ B = \frac{\mu_0 I N r^2}{2\left(r^2 + x^2\right)^2} \]

(OR)

(a) Current sensitivity: It is defined as the amount of deflection produced per unit magnitude of current passes.

\[ C_s = \frac{\Phi}{I} \text{ or } C_s = \frac{NAB}{k} \]

(b) (i)

\[ I_0 \]

\[ G \]

\[ I_g \]

\[ I_0 - I_g \]

\[ S \]

(G) can be converted into an ammeter by connecting a small stunt resistance parallel to (G) coil so that

\[ I_g G = (I_0 - I_g) S \]

\[ \Rightarrow S = \frac{I_g G}{I_0 - I_g} \]

(ii) Effective resistance of (A) \( \Rightarrow \frac{GS}{G + S} \)
34. Energy released = $Q = 7.835 \times 231 + 7.07 \times 4 - 7.8 \times 235$

$\Rightarrow Q = 1809.885 + 28.28 - 1833$

$= 5.165 \text{ MeV}$

$= 5.165 \times 1.6 \times 10^{-13} \text{ J}$

This energy will be taken away by $\alpha$-particle as kinetic energy.

$\therefore \frac{1}{2} mv^2 = Q$

$\Rightarrow$ Speed of $\alpha$-particle

$v = \sqrt{\frac{5.165 \times 1.6 \times 10^{-13} \times 2}{6.68 \times 10^{-27}}}$

$= \sqrt{\frac{16.528 \times 10^{14}}{6.68}} = \sqrt{2.474 \times 10^7}$

$= 1.573 \times 10^7 \text{ m/s}$

SECTION – D

35. (a)

$PQ = RS = l$

$PS = QR = b$

Area $A = lb$

$\vec{M} \times I \vec{A}$

$\vec{F}_{PQ} = llB \bigotimes$

$\vec{F}_{RS} = llB \bigotimes$
\[ \vec{F}_{QR} = IbB \sin (90^\circ - \theta) = IbB \cos \theta \quad \text{up} \]

\[ \vec{F}_{SP} = IbB \sin (90^\circ - \theta) = IbB \cos \theta \quad \text{down} \]

Only \( \vec{F}_{PB} \) & \( \vec{F}_{RS} \) form a couple to apply torque on loop

\[ \tau = F_{PQ} (AQ) = (Ilb)(B \sin \theta) \]

\[ = I(lb)B \sin \theta \]

\[ \Rightarrow \tau = MB \sin \theta \]

Magnetic field is taken radial in Galvanometer coil in order to create \( \theta = 90^\circ \) at every orientation of coil in the magnetic field so that current varies linearly with deflection.

(b) \( qV = \frac{1}{2}mv^2 \Rightarrow v = \sqrt{\frac{2qV}{m}} \)

\[ \therefore \quad v = vi \perp \vec{B} (= Bj) \]

\[ \therefore \quad \text{Particle deflects along circular path of radius} \quad r = \frac{mv}{qB} = \frac{m}{qB} \sqrt{\frac{2qV}{m}} = \frac{1}{B} \sqrt{\frac{2mv}{q}} \]

\[ r = \frac{1}{2 \times 10^{-3}} \sqrt{\frac{2 \times 6.4 \times 10^{-27} \times 10^4}{2 \times 1.6 \times 10^{-19}}} \]
AC voltage $v_1$ is applied at primary P of transformer (with turns $N_P$).

By self induction, pot diff developed is

$$e_p = -N_p \frac{d\phi}{dt} = v_1$$

Also, by mutual induction, pot diff developed in secondary (turns $N_S$)

$$e_s = -N_s \frac{d\phi}{dt} = v_0 = \text{output AC voltage}$$

Here $\frac{d\phi}{dt} = \text{time rate of charge of magnetic flux of each turn}$

Thus, $\frac{e_s}{e_p} = \frac{N_S}{N_P} = \frac{v_0}{v_1}$

(i) Core is laminated to block or minimize the paths of eddy currents to minimize heat loss against resistance of core.
(ii) Thick copper wire is used in order to reduce the resistance of transformer coil to minimize heat loss.

(b) (i) \[ F = ilB = \left( \frac{Blv}{R} \right)IB = \frac{B^2l^2v}{R} \]

\[ = \left( 0.4 \right)^2 \times \left( 20 \times 10^{-2} \right)^2 \times \left( 10 \times 10^{-2} \right) \]

\[ = \frac{0.1}{640 \times 10^{-4+2+1}} = 6.4 \times 10^{-3} N \]

(ii) Power = \[ P = Fv = \frac{B^2l^2v^2}{R} \]

\[ = 6.4 \times 10^{-3} \times 10 \times 10^{-2} \]

\[ = 6.4 \times 10^{-4} \text{ watt} \]

36. (a)

![Diagram](resolving_power_diagram)

Resolving power = \[ \frac{D}{1.22 \lambda} \]

(b) (i) \[ m = \frac{f_0}{f_e} = \frac{-20}{10-2} = -2000 \]
\[ \tan \alpha = \frac{d_0}{u} = \frac{d_i}{f_0} \]

\[ \Rightarrow d_i = \frac{3.5 \times 10^6}{3.8 \times 10^3} \times 20 = 0.18 \text{ m} \]

**(OR)**

(a)

\[ \Delta ABC \sim \Delta A_1B_1C \Rightarrow \frac{A_1B_1}{AB} = \frac{A_1C}{AC} = \frac{(+v) + (-R)}{(-R) - (-u)} \]

\[ \Delta ABP \sim \Delta A_1B_1P \Rightarrow \frac{A_1B_1}{AB} = \frac{A_1P}{AP} = \frac{+v}{-u} \]
(1) = (2) \Rightarrow \frac{v-R}{-R+u} = \frac{v}{-u}

\Rightarrow -uv + uR = -vR + uv

\Rightarrow uR + vR = 2uv

\div by \ uvR \Rightarrow \frac{1}{v} + \frac{1}{u} = \frac{2}{R}

\therefore R = 2f \therefore \frac{1}{v} + \frac{1}{u} = \frac{1}{f}

(b) \frac{1}{f} = (1.5 - 1) \left( \frac{1}{20} - \frac{1}{\infty} \right) = \frac{0.5}{20} = \frac{5}{200} = \frac{1}{40}

\therefore f = 40 \text{ cm}

Now \frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow v = \frac{fu}{f+u} = \frac{40 \times -30}{40 - 30}

\Rightarrow v = \frac{-40 \times 30}{10} = -120 \text{ cm}

Image is virtual, erect and enlarged in front of lens 120 cm away.

37. (a)
S₁ & S₂ are two Gaussian spheres respectively for points

\[ P_1(x < R) \quad \& \quad P_2(x > R) \]

(i) By Gauss law,
Net outward flux through \( S_1 \)

\[ \phi = \oint_{S_1} \vec{E} \cdot d\vec{A} = \frac{q_1}{\varepsilon_0} \rightarrow \text{charge enclosed by } S_1 = -0 \]

\[ \Rightarrow E = 0 \]

(ii) Net outward flux through \( S_2 \)

\[ \phi = \oint_{S_2} \vec{E} \cdot d\vec{A} = \frac{q_2}{\varepsilon_0} \rightarrow \text{charge enclosed by } S_1 = \sigma \left( 4\pi R^2 \right) \]

\[ \Rightarrow E \oint_{S_2} dA = \frac{\sigma \left( 4\pi R^2 \right)}{\varepsilon_0} \]

\[ \therefore \quad \oint_{S_2} dA = 4\pi x^2 \Rightarrow E = \frac{\sigma \left( 4\pi R^2 \right)}{(4\pi r^2)\varepsilon_0} \]

\[ \Rightarrow E = \frac{\sigma R^2}{\varepsilon_0 x^2} \]

(b)
(i) \( d = d_1 + d_2 + d_3 \)
\[ = E \left( \pi r^2 \right) + E \left( \pi r^2 \right) + 0 \]
\[ = 2E \pi r^2 \]
\[ = 2 \times 200 \times 3.14 \times \left( 5 \times 10^{-2} \right)^2 \]
\[ = 31400 \times 10^{-4} = 3.14 \, N - \frac{m^2}{C} \]

(ii) Net charge \( q = d \varepsilon_0 \)
\[ q = 3.14 \times 8.854 \times 10^{-12} \]
\[ = 27.8 \times 10^{-12} \, C \]

(OR)

(a)

Work done to bring \( q_1 \) from \( \infty \) in electric field
\[ \mathbf{E}_1 \Rightarrow W_1 = q_1 V \left( r_1 \right) \]

Work done to bring \( q_2 \) in field \( \mathbf{E}_k \) & of field of \( q_2 \)
\[ W_2 = q_2 V \left( r_2 \right) + \frac{kq_1q_2}{r_{12}} \]

\[ \therefore \text{ Potential energy of system} \]
\[ U = W_1 + W_2 = q_1V(r_1) + q_2V(r_2) + \frac{kq_1^2q_2}{|r_2 - r_1|} \]

(b) [Equation diagram]

(c) \( W = \) Energy of system
\[ = U_{12} + U_{13} + U_{23} \]
\[ = \frac{k}{r} (q_1q_2 + q_2q_3 + q_1q_3) \]
\[ = \frac{9 \times 10^9}{10 \times 10^{-2}} \left( (+1)(-1) + (+1)(+2) + (-1)(+2) \right) \times 10^{-12} \]
\[ = 9 \times 10^{-2} (-1 + 2 - 2) = -0.09 J \]
