

## Exercise 1.5

Page: 24

1. Classify the following numbers as rational or irrational:

(i)  $2 - \sqrt{5}$

**Solution:**

We know that,  $\sqrt{5} = 2.2360679\dots$

Here,  $2.2360679\dots$  is non-terminating and non-recurring.

Now, substituting the value of  $\sqrt{5}$  in  $2 - \sqrt{5}$ , we get,

$$2 - \sqrt{5} = 2 - 2.2360679\dots = -0.2360679$$

Since the number,  $-0.2360679\dots$ , is non-terminating non-recurring,  $2 - \sqrt{5}$  is an irrational number.

(ii)  $(3 + \sqrt{23}) - \sqrt{23}$

**Solution:**

$$\begin{aligned}(3 + \sqrt{23}) - \sqrt{23} &= 3 + \sqrt{23} - \sqrt{23} \\ &= 3 \\ &= 3/1\end{aligned}$$

Since the number  $3/1$  is in  $p/q$  form,  $(3 + \sqrt{23}) - \sqrt{23}$  is rational.

(iii)  $2\sqrt{7/7\sqrt{7}}$

**Solution:**

$$2\sqrt{7/7\sqrt{7}} = (2/7) \times (\sqrt{7}/\sqrt{7})$$

We know that  $(\sqrt{7}/\sqrt{7}) = 1$

$$\text{Hence, } (2/7) \times (\sqrt{7}/\sqrt{7}) = (2/7) \times 1 = 2/7$$

Since the number,  $2/7$  is in  $p/q$  form,  $2\sqrt{7/7\sqrt{7}}$  is rational.

(iv)  $1/\sqrt{2}$

**Solution:**

Multiplying and dividing numerator and denominator by  $\sqrt{2}$  we get,

$$(1/\sqrt{2}) \times (\sqrt{2}/\sqrt{2}) = \sqrt{2}/2 \quad (\text{since } \sqrt{2} \times \sqrt{2} = 2)$$

We know that,  $\sqrt{2} = 1.4142\dots$

Then,  $\sqrt{2}/2 = 1.4142/2 = 0.7071\dots$

Since the number,  $0.7071\dots$  is non-terminating non-recurring,  $1/\sqrt{2}$  is an irrational number.

(v)  $2\pi$

**Solution:**

We know that, the value of  $\pi = 3.1415$

Hence,  $2\pi = 2 \times 3.1415\dots = 6.2830\dots$

Since the number,  $6.2830\dots$ , is non-terminating non-recurring,  $2\pi$  is an irrational number.

2. Simplify each of the following expressions:

(i)  $(3 + \sqrt{3})(2 + \sqrt{2})$

**Solution:**

$$(3+\sqrt{3})(2+\sqrt{2})$$

Opening the brackets, we get,  $(3 \times 2) + (3 \times \sqrt{2}) + (\sqrt{3} \times 2) + (\sqrt{3} \times \sqrt{2})$   
 $= 6 + 3\sqrt{2} + 2\sqrt{3} + \sqrt{6}$

**(ii)  $(3+\sqrt{3})(2+\sqrt{2})$**

**Solution:**

$$(3+\sqrt{3})(2+\sqrt{2}) = 3^2 - (\sqrt{3})^2 = 9 - 3 = 6$$

**(iii)  $(\sqrt{5}+\sqrt{2})^2$**

**Solution:**

$$(\sqrt{5}+\sqrt{2})^2 = \sqrt{5}^2 + (2 \times \sqrt{5} \times \sqrt{2}) + \sqrt{2}^2 = 5 + 2\sqrt{10} + 2 = 7 + 2\sqrt{10}$$

**(iv)  $(\sqrt{5}-\sqrt{2})(\sqrt{5}+\sqrt{2})$**

**Solution:**

$$(\sqrt{5}-\sqrt{2})(\sqrt{5}+\sqrt{2}) = (\sqrt{5}^2 - \sqrt{2}^2) = 5 - 2 = 3$$

**3. Recall,  $\pi$  is defined as the ratio of the circumference (say c) of a circle to its diameter, (say d). That is,  $\pi = c/d$ . This seems to contradict the fact that  $\pi$  is irrational. How will you resolve this contradiction?**

**Solution:**

There is no contradiction. When we measure a value with a scale, we only obtain an approximate value. We never obtain an exact value. Therefore, we may not realize whether c or d is irrational. The value of  $\pi$  is almost equal to  $22/7$  or  $3.142857\dots$

**4. Represent  $(\sqrt{9.3})$  on the number line.**

**Solution:**

Step 1: Draw a 9.3 units long line segment, AB. Extend AB to C such that BC=1 unit.

Step 2: Now, AC = 10.3 units. Let the centre of AC be O.

Step 3: Draw a semi-circle of radius OC with centre O.

Step 4: Draw a BD perpendicular to AC at point B intersecting the semicircle at D. Join OD.

Step 5: OBD, obtained, is a right angled triangle.

Here, OD = 10.3/2 (radius of semi-circle), OC = 10.3/2, BC = 1

$$OB = OC - BC$$

$$\Rightarrow (10.3/2) - 1 = 8.3/2$$

Using Pythagoras theorem,

We get,

$$OD^2 = BD^2 + OB^2$$

$$\Rightarrow (10.3/2)^2 = BD^2 + (8.3/2)^2$$

$$\Rightarrow BD^2 = (10.3/2)^2 - (8.3/2)^2$$

$$\Rightarrow (BD)^2 = (10.3/2) \cdot (10.3/2) - (8.3/2) \cdot (8.3/2)$$

$$\Rightarrow BD^2 = 9.3$$

$$\Rightarrow BD = \sqrt{9.3}$$

Thus, the length of BD is  $\sqrt{9.3}$ .

Step 6: Taking

BD as radius and B as centre draw an arc which touches the line segment. The point where it touches the line segment is at a distance of  $\sqrt{9.3}$  from O as shown in the figure.

**5. Rationalize the denominators of the following:**

(i)  $1/\sqrt{7}$

**Solution:**

Multiply and divide  $1/\sqrt{7}$  by  $\sqrt{7}$

$$(1 \times \sqrt{7})/(\sqrt{7} \times \sqrt{7}) = \sqrt{7}/7$$

(ii)  $1/(\sqrt{7}-\sqrt{6})$

**Solution:**

Multiply and divide  $1/(\sqrt{7}-\sqrt{6})$  by  $(\sqrt{7}+\sqrt{6})$

$$[1/(\sqrt{7}-\sqrt{6})] \times (\sqrt{7}+\sqrt{6})/(\sqrt{7}+\sqrt{6}) = (\sqrt{7}+\sqrt{6})/(\sqrt{7}-\sqrt{6})(\sqrt{7}+\sqrt{6})$$

$$= (\sqrt{7}+\sqrt{6})/\sqrt{7^2-6^2} \text{ [denominator is obtained by the property, } (a+b)(a-b) = a^2-b^2]$$

$$= (\sqrt{7}+\sqrt{6})/(7-6)$$

$$= (\sqrt{7}+\sqrt{6})/1$$

$$= \sqrt{7}+\sqrt{6}$$

(iii)  $1/(\sqrt{5}+\sqrt{2})$

**Solution:**

Multiply and divide  $1/(\sqrt{5}+\sqrt{2})$  by  $(\sqrt{5}-\sqrt{2})$

$$[1/(\sqrt{5}+\sqrt{2})] \times (\sqrt{5}-\sqrt{2})/(\sqrt{5}-\sqrt{2}) = (\sqrt{5}-\sqrt{2})/(\sqrt{5}+\sqrt{2})(\sqrt{5}-\sqrt{2})$$

$$= (\sqrt{5}-\sqrt{2})/(\sqrt{5^2-2^2}) \text{ [denominator is obtained by the property, } (a+b)(a-b) = a^2-b^2]$$

$$= (\sqrt{5}-\sqrt{2})/(5-2)$$

$$= (\sqrt{5}-\sqrt{2})/3$$

(iv)  $1/(\sqrt{7}-2)$

**Solution:**

Multiply and divide  $1/(\sqrt{7}-2)$  by  $(\sqrt{7}+2)$

$$1/(\sqrt{7}-2) \times (\sqrt{7}+2)/(\sqrt{7}+2) = (\sqrt{7}+2)/(\sqrt{7}-2)(\sqrt{7}+2)$$

$$= (\sqrt{7}+2)/(\sqrt{7^2-2^2}) \text{ [denominator is obtained by the property, } (a+b)(a-b) = a^2-b^2]$$

$$= (\sqrt{7}+2)/(7-4)$$

$$= (\sqrt{7}+2)/3$$
