(i) Size of a plant cell to the thickness of a piece of paper.
(ii) Size of a plant cell to the diameter of a wire on a computer chip.
(iii) The thickness of a piece of paper to the diameter of a wire on a computer chip.
Given size of plant cell = 0.00001275 m
Thickness of a piece of paper = 0.0016 cm
Diameter of a wire on a computer chip = 0.000003 m
Solution:
Given:
Size of plant cell= 0.00001275 m = 1.275×10^{-5} m
Thickness of a piece of paper = 0.0016 cm = 1.6×10^{-3} cm
Diameter of a wire on a computer chip = 0.000003 m = 3.0×10^{-6} m

(i) Size of plant cell: thickness of a piece of paper
1.275×10^{-5}: 1.6×10^{-3}
Size of plant cell = 1.2/1.6 = 3/4 times of thickness of paper.

(ii) Size of plant cell: diameter of wire on a computer chip
1.275×10^{-5}: 3.0×10^{-6}
12.75: 3.00
Size of plant cell is 4 times of diameter of wire.

(iii) Thickness of a piece of paper: diameter of a wire on a computer chip
1.6×10^{-3}: $3.0 \times 10^{-6} \times 100$ cm
1.6×1000: 300
16.1: 3
Approximately 5 times is the thickness of paper to diameter of wire.

5. The number of red blood cells per cubic millimeter of blood is approximately 5.5 million. If the average body contains 5 liters of blood, what is the total number of red cell in the body? (1 liter = 1,00,000 mm^3)

Solution:

Given:

Red blood per cubic millimeter = 5.5 million = 5.5×10^6

Red blood in 5 liters of blood = $5.5 \times 10^6 \times 5 \times 10^5$ (1 litre = 10^5 mm)

$= 27.5 \times 10^{6+5}$

$= 27.5 \times 10^{11}$

$= 2.75 \times 10 \times 10^{11}$

$= 2.75 \times 10^{12}$

∴ Total number of red blood cells in the body is 2.75×10^{12}.

6. Mass of Mars is 6.42×10^{29} kg and the mass of the sun is 1.99×10^{30} kg. What is the total mass?

Solution:

Given:

Mass of Mars = 6.42×10^{29} kg

and mass of sun = 1.99×10^{30}

Total mass = $6.42 \times 10^{29} + 1.99 \times 10^{30}$

$= 10^{29} (6.42 + 1.99 \times 10)$

$= 10^{29} (6.42 + 19.9)$

$= 26.32 \times 10^{29}$

∴ Total mass of mars is 26.32×10^{29}.

7. A particular star is at a distance of about 8.1×10^{13} km from the Earth. Assuming that the light travels at 3×10^8 m/sec, find how long does light take from that star to reach the Earth.

Solution:

Given:

Distance between earth and a particular star = 8.1×10^{13} km

Speed of light = 3×10^8 m/sec.

Time is taken to reach the earth = $(8.1 \times 10^{13})/(3 \times 10^8)$

$= 2.7 \times 10^{16-8}$

$= 2.7 \times 10^8$ sec

∴ Light takes 2.7×10^8 sec from star to reach the earth.
