

Multiple Choice Questions I

13.1. A cubic vessel (with faces horizontal + vertical) contains an ideal gas at NTP. The vessel is being carried by a rocket which is moving at a speed of 500 m/s in vertical direction. The pressure of the gas inside the vessel as observed by us on the ground

- a) remains the same because 500 m/s is very much smaller than v_{rms} of the gas
- b) remains the same because motion of the vessel as a whole does not affect the relative motion of the gas molecules and the walls

$$v_{rms}^2 + 500^2 / v_{rms}^2$$

c) will increase by a factor equal to velocity of the gas

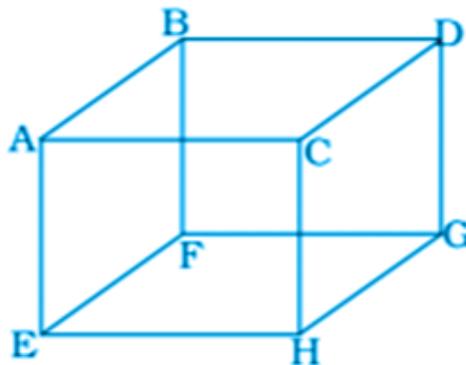

where v_{rms} was the original mean square

d) will be difference on the top wall and bottom wall of the vessel

Answer:

The correct answer is b) remains the same because motion of the vessel as a whole does not affect the relative motion of the gas molecules and the walls

13.2. 1 mole of an ideal gas is contained in a cubical volume V, ABCDEFGH at 300 K. One face of the cube (EFGH) is made up of a material which totally absorbs any gas molecule incident on it. At any given time,

- a) the pressure on EFGH would be zero
- b) the pressure on all the faces will be equal
- c) the pressure of EFGH would be double the pressure on ABCD
- d) the pressure on EFGH would be half that on ABCD

Answer:

The correct answer is d) the pressure on EFGH would be half that on ABCD

13.3. Boyle's law is applicable for an

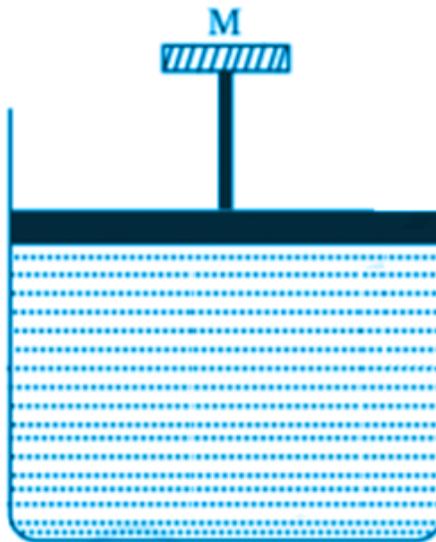

- a) adiabatic process

- b) isothermal process
- c) isobaric process
- d) isochoric process

Answer:

The correct answer is b) isothermal process

13.4. A cylinder containing an ideal gas is in vertical position and has a piston of mass M that is able to move up or down without friction. If the temperature is increase,

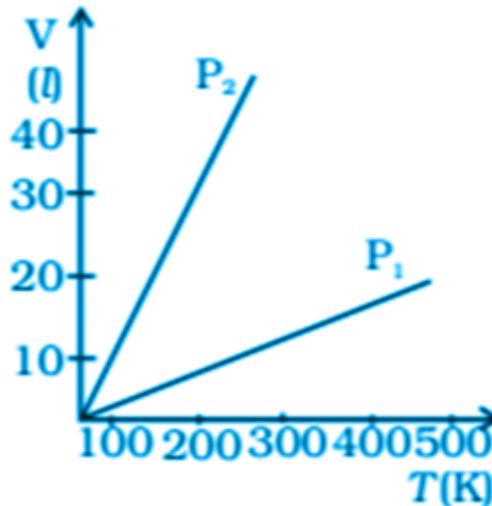

- a) both p and V of the gas will change
- b) only p will increase according to Charle's law
- c) V will change but not p
- d) p will change but not V

Answer:

The correct answer is c) V will change but not p

13.5. Volume versus temperature graphs for a given mass of an ideal gas are shown in figure at two different values of constant pressure. What can be inferred about relation between P_1 and P_2 ?

- a) $P_1 > P_2$
- b) $P_1 = P_2$
- c) $P_1 < P_2$
- d) data is insufficient

Answer:

The correct answer is a) $P_1 > P_2$

13.6. 1 mole of H_2 gas is contained in a box of volume $V = 1.00 \text{ m}^3$ at $T = 300 \text{ K}$. The gas is heated to a temperature of $T = 3000 \text{ K}$ and the gas gets converted to a gas of hydrogen atoms. The final pressure would be

- a) same as the pressure initially
- b) 2 times the pressure initially
- c) 10 times the pressure initially
- d) 20 times the pressure initially

Answer:

The correct answer is d) 20 times the pressure initially

13.7. A vessel of volume V contains a mixture of 1 mole of hydrogen and 1 mole of oxygen. Let $f_1(v)dv$, denote the fraction of molecules with speed between v and $(v + dv)$ with $f_2(v)dv$ similarly for oxygen. Then

- a) $f_1(v) + f_2(v) = f(v)$ obeys the Maxwell's distribution law
- b) $f_1(v)$, $f_2(v)$ will obey the Maxwell's distribution law separately
- c) neither $f_1(v)$ nor $f_2(v)$ will obey the Maxwell's distribution law
- d) $f_2(v)$ and $f_1(v)$ will be the same

Answer:

The correct answer is b) $f_1(v)$, $f_2(v)$ will obey the Maxwell's distribution law separately

13.8. An inflated rubber balloon contains one mole of an ideal gas, has a pressure p , volume V , and temperature T . If the temperature rises to $1.1T$ and the volume is increased to $1.05V$, the final pressure will be

- a) $1.1 p$

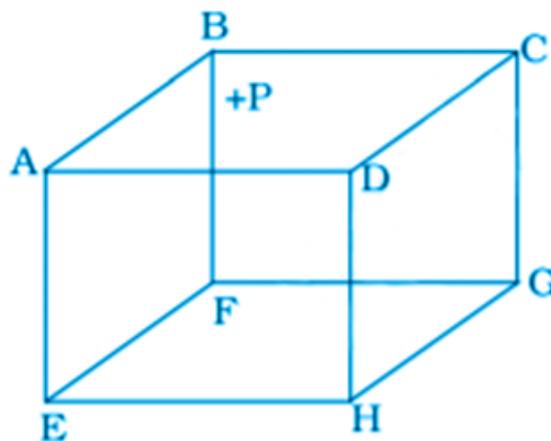

- b) p
- c) less than p
- d) between p and 1.1

Answer:

The correct answer is d) between p and 1.1

Multiple Choice Questions II

13.9. ABCDEFGH is a hollow cube made of an insulator. Face ABCD has positive charge on it. Inside the cube, we have ionized hydrogen. The usual kinetic theory expression for pressure

- a) will be valid
- b) will not be valid since the ions would experience forces other than due to collision with the walls
- c) will not be valid since collisions with walls would not be elastic
- d) will not be valid because isotropy is lost

Answer:

The correct answer is

- b) will not be valid since the ions would experience forces other than due to collision with the walls
- d) will not be valid because isotropy is lost

13.10. Diatomic molecules like hydrogen have energies due to both translational as well as rotational motion. From the equation in kinetic theory $pV = \frac{2}{3} E$, E is

- a) the total energy per unit volume
- d) only the translational part of energy because rotational energy is very small compared to the translational energy
- c) only the translational part of the energy because during collisions with the wall pressure relates to change in linear momentum
- d) the translational part of the energy because rotational energies of molecules can be either sign and its average over all the molecules is zero

Answer:

The correct answer is c) only the translational part of the energy because during collisions with the wall pressure relates to change in linear momentum

13.11. In a diatomic molecules, the rotational energy at a given temperature

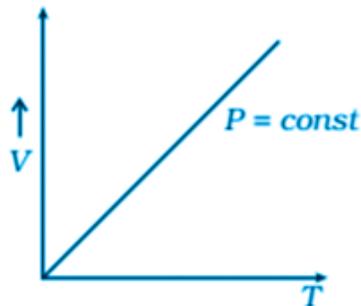

- a) obeys Maxwell's distribution
- b) have the same value for all molecules
- c) equals the translational kinetic energy for each molecules
- d) is $2/3^{\text{rd}}$ the translational kinetic energy for each molecule

Answer:

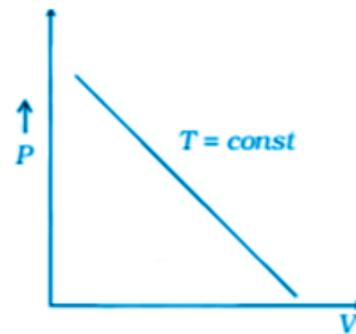

The correct answer is

- a) obeys Maxwell's distribution
- d) is $2/3^{\text{rd}}$ the translational kinetic energy for each molecule

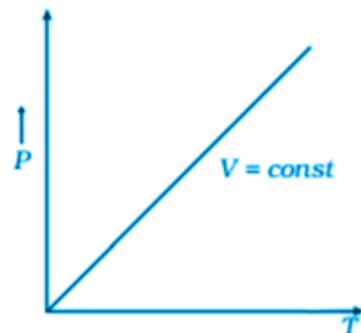

13.12. Which of the following diagrams depicts ideal gas behaviour?

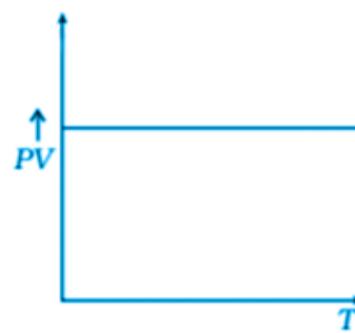

(a)

(b)

(c)

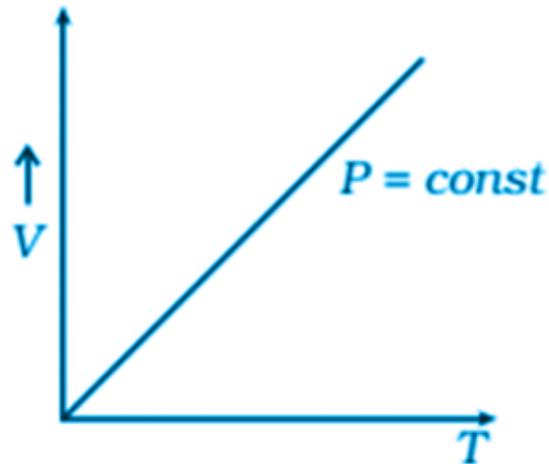

(d)

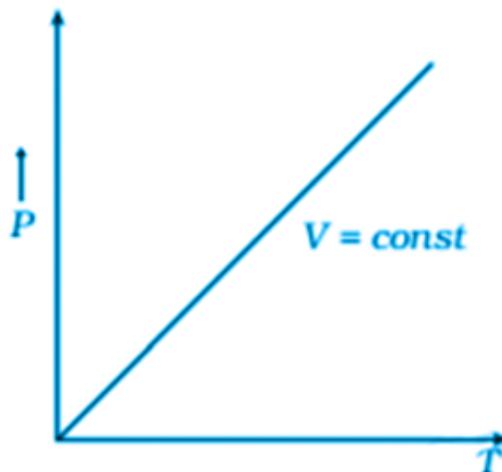

Answer:

The correct answer is

- a)

c)

- 13.13. When an ideal gas is compressed adiabatically, its temperature rises: the molecules on the average have more kinetic energy than before. The kinetic energy increases,
- a) because of collisions with moving parts of the wall only
 - b) because of collisions with the entire wall
 - c) because the molecules get accelerated in their motion inside the volume
 - d) because of redistribution of energy amongst the molecules

Answer:

The correct answer is a) because of collisions with moving parts of the wall only

Very Short Answers

13.14. Calculate the number of atoms in 39.4 g gold. Molar mass of gold is 197 g/mole.

Answer:

$$\text{Molar mass} = 6.023 \times 10^{23} \text{ atoms}$$

$$\text{Mass of gold, } m = 39.4 \text{ g}$$

$$\text{Molar mass of gold, } M = 197 \text{ g/mol}$$

$$196 \text{ g of gold contains } 6.023 \times 10^{23} \text{ atoms}$$

$$39.4 \text{ g of gold contains } 1.20 \times 10^{23} \text{ atoms.}$$

13.15. The volume of a given mass of a gas at 27°C, 1 atm is 100 cc. What will be its volume at 327°C.

Answer:

$$T_1 = 27^\circ\text{C}$$

$$T_1 = 300 \text{ K}$$

$$V_1 = 100 \text{ cm}^3$$

We know that V is proportional to T

$$V/T = \text{constant}$$

$$V_1/T_1 = V_2/T_2$$

$$V_2 = V_1(T_2/T_1)$$

$$V_2 = 200 \text{ cc}$$

13.16. The molecules of a given mass of a gas have root mean square speeds of 100 m/s at 27°C and 1.00 atmospheric pressure. What will be the root mean square speeds of the molecules of the gas at 127°C and 2.0 atmospheric pressure?

Answer:

$$V_{\text{rms}} = 100 \text{ m/s}$$

$$T_1 = 300 \text{ K}$$

$$T_2 = 400 \text{ K}$$

$$V_{\text{rms}} = \sqrt{3RT/M}$$

$$V_{2\text{rms}} = ?$$

$$V_{\text{rms}} = 115.4 \text{ m/s}$$

13.17. Two molecules of a gas have speeds of $9 \times 10^6 \text{ m/s}$ and $1 \times 10^6 \text{ m/s}$ respectively. What is the root mean square speed of these molecules.

Answer:

$$V_1 = 9 \times 10^6 \text{ m/s}$$

$$V_2 = 1 \times 10^6 \text{ m/s}$$

$$V_{\text{rms}} = 6.4 \times 10^6 \text{ m/s}$$

13.18. A gas mixture consists of 2.0 moles of oxygen and 4.0 moles of neon at a temperature T. Neglecting all vibrational modes, calculate the total internal energy of the system. (Oxygen has two rotational modes.)

Answer:

$$\text{Degree of freedom of oxygen} = 5$$

$$\text{Total internal energy of 2 mole oxygen} = 5RT$$

$$\text{Total internal energy of 4 mole of Ne} = 6RT$$

$$\text{Total internal energy of the system} = 11 RT$$

13.19. Calculate the ratio of the mean free paths of the molecules of two gases having molecular diameters 1 A and 2 A. The gases may be considered under identical conditions of temperature, pressure, and volume.

Answer:

The ratio of the mean free paths of the molecules is 4:1.

Short Answers

13.20. The container shown in figure has two chambers, separated by a partition, of volumes $V_1 = 2.0$ litre and $V_2 = 3.0$ litre. The chambers contain $\mu_1 = 4.0$ and $\mu_2 = 5.0$ moles of a gas at pressure $p_1 = 1.00$ atm and $p_2 = 2.00$ atm. Calculate the pressure after the partition is removed and the mixture attains equilibrium.

V1	V2
μ_1	μ_2
p1	p2

Answer:

For an ideal gas, $PV = \mu RT$

$$P_1 V_1 = \mu_1 R T_1$$

$$P_2 V_2 = \mu_2 R T_2$$

$$P_1 = 1 \text{ atm}$$

$$P_2 = 2 \text{ atm}$$

$$V_1 = 2 \text{ L}$$

$$V_2 = 3 \text{ L}$$

$$T_1 = T = T_2$$

$$\mu_1 = 4$$

$$\mu_2 = 5$$

Substituting all the values we get, $P = 1.6 \text{ atm}$

13.21. A gas mixture consists of molecules of types A, B, and C with masses $m_A > m_B > m_C$. Rank the three types of molecules in decreasing order of

a) average KE

b) rms speeds

Answer:

a) Pressure and temperature are same therefore,

$$KE_c > KE_b > KE_a$$

b) When P and T are constant, $(V_{rms})_c > (V_{rms})_b > (V_{rms})_a$

13.22. We have 0.5 g of hydrogen gas in a cubic chamber of size 3 cm kept at NTP. The gas in the chamber is compressed keeping the temperature constant till a final pressure of 100 atm. Is one justified in assuming the ideal gas law, in the final state?

Answer:

$$\text{Volume of 1 molecule} = \frac{4}{3} \pi r^3 = 4.20 \times 10^{-30} \text{ m}^3$$

$$\text{No. of moles in 0.5 g H}_2 \text{ gas} = 0.25 \text{ mole}$$

$$\text{Volume of H}_2 \text{ molecule in 0.25 mole} = 1.04 \times 6.023 \times 10^{+23-30}$$

13.23. When air is pumped into a cycle tyre the volume and pressure of the air in the tyre both are increased. What about Boyle's law in this case?

Answer:

$$PV = P(m/\rho) = \text{constant}$$

$P/\rho = \text{constant}$

Volume = m/ρ where m is constant

Therefore, when the air is pumped into the tyre of the cycle, the mass of air increases as the no. of molecules increases. Therefore, Boyle's law is only applicable when mass of the gas remains fixed.

13.24. A balloon has 5.0 g mole of helium at 7°C. Calculate

a) the number of atoms of helium in the balloon

b) the total internal energy of the system

Answer:

Average KE per molecule = $3/2kT$

No. of moles of helium, $n = 5$ g mole

$T = 280$ K

a) No. of atoms of helium in the balloon = 30.015×10^{23}

b) $KE = 3/2 kbT$

Total internal energy = 1.7×10^4 J

13.25. Calculate the number of degrees of freedom of molecules of hydrogen in 1 cc of hydrogen gas at NTP.

Answer:

The volume occupied by the molecules of gas = 22400 cc

No. of molecules in 1 cc of hydrogen = 2.688×10^{19}

Hydrogen has total of 5 degrees of free as it is a diatomic gas

Therefore, the total degrees of freedom = 1.344×10^{20}

13.26. An insulated container containing monoatomic gas of molar mass m is moving with a velocity v_0 . If the container is suddenly stopped, find the change in temperature.

Answer:

The final KE of the gas = 0

Change in KE, $\Delta K = 1/2 (nm)v^2$

ΔT is the change in the temperature

$\Delta U = nC_v\Delta T$

$\Delta K = \Delta U$

$\Delta T = mv_0^2/3R$

Long Answers

13.27. Explain why

a) there is no atmosphere on moon

b) there is fall in temperature with altitude

Answer:

a) There is no atmosphere on moon because the gravitational force is small and the V_{rms} is the greater on the moon such that the escape velocity of the molecule is greater than that of the air. Also, the distance between the moon and the sun is same as the distance between the moon and the earth. Therefore, the rms speed of the molecule increases such that it can be more than the escape velocity. Therefore, there is no atmosphere on the moon.

b) There is fall in temperature with altitude because at the higher altitude the gas molecules expand and there is decrease in temperature as the expansion of gas resulting in cooling of the surrounding. This results in increase in the kinetic energy of the molecules. When the kinetic energy increases, temperature decreases.

13.28. Consider an ideal gas with the following distribution of speeds

Speed (m/s)	% of molecules
200	10
400	20
600	40
800	20
1000	10

a) calculate V_{rms} and hence T ($m = 3.0 \times 10^{-26}$ kg)

b) if all the molecules with speed 1000 m/s escape from the system, calculate new V_{rms} and hence T

Answer:

a) $T = 296$ K

b) $T = 248.04$ K

13.29. Ten small planners are flying at a speed of 150 km/h in total darkness in an air space that is $20 \times 20 \times 1.5$ km³ in volume. You are in one of the planes, flying at random within this space with no way of knowing where the other planes are. On the average about how long a time will elapse between near collision with your plane. Assume for this rough computation that a safety region around the plane can be approximated by a sphere of radius 10 m.

Answer:

Time = distance/speed

No. of particles per unit volume $n = N/\text{volume}$

$n = 0.0167$ km⁻³

$d = 10 \times 10^{-3}$ km

$v = 150$ km/hr

Therefore, time = 225 hrs

13.30. A box of 1.00 m³ is filled with nitrogen at 1.50 atm at 300 K. The box has a hole of an area 0.010 mm². How much time is required for the pressure to reduce by 0.10 atm, if the pressure outside is 1 atm.

Answer:

Volume of the box = 1 m³ = V_1

Initial pressure $P_1 = 1.5$ atm

Final pressure $P_2 = 1.4$ atm

Air pressure $P_a = 1$ atm

Initial temperature $T_1 = 300$ K

Final temperature $T_2 = 300$ K

Area of the hole = 10^{-8} m²

Pressure difference between tyre and atmosphere = $1.5 - 1$ atm

Mass of nitrogen = 46.5×10^{-27} kg

Using the above information, we can calculate the time required as $\tau = 1.34 \times 10^5$ sec

13.31. Consider a rectangular block of wood moving with a velocity v_0 in a gas at temperature T and mass density ρ . Assume the velocity is along x-axis and the area of cross-section of the block perpendicular to v_0

$$4\rho A v_0 \sqrt{\frac{kT}{m}}$$

is A. Show that the drag force on the block is molecule.

, where m is the mass of the gas

Answer:

Let ρn is the no. of molecules per unit volume

Change in momentum by a molecule on front side = $2m(v + v_0)$

Change in momentum by a molecule on back side = $2m(v - v_0)$

No. of molecules striking front side = $\frac{1}{2} [A(v+v_0)\Delta t] \rho n$

No. of molecules striking back side = $\frac{1}{2} [A(v-v_0)\Delta t] \rho n$

Solving the above equation by considering the KE of the gas molecule, we get the dragging force as $4m A \rho n v_0 \sqrt{\frac{3}{2} k_B T}$
