Comprehension Type
This section contains 2 groups of questions. Each group has 3 multiple-choice questions based on a paragraph. Each question has 4 choices (A), (B), (C) and (D) for its Answer, out of which ONLY ONE is correct.

Paragraph for Question Nos. 13 to 15
p-Amino-N, N-dimethylaniline is added to a strongly acidic solution of X. The resulting solution is treated with a few drops of aqueous solution of Y to yield blue coloration due to the formation of methylene blue. Treatment of the aqueous solution of Y with the reagent potassium hexacyanoferrate(II) leads to the formation of an intense blue precipitate. The precipitate dissolves on excess addition of the reagent. Similarly, treatment of the solution of Y with the solution of potassium hexacyanoferrate(III) leads to a brown colouration due to the formation of Z.

13. The compound X is
(A) NaNO$_3$
(B) NaCl
(C) Na$_2$SO$_4$
(D) Na$_2$S
14. The compound Y is
(A) MgCl₂
(B) FeCl₂
(C) FeCl₃
(D) ZnCl₂

15. The compound Z is
(A) Mg₂[Fe(CN)₆]
(B) Fe[Fe(CN)₆]
(C) Fe₄[Fe(CN)₆]₃
(D) K₂Zn₃[Fe(CN)₆]₂
Paragraph for Question Nos. 16 to 18
A carbonyl compound P, which gives positive iodoform test, undergoes reaction with MeMgBr followed by dehydration to give an olefin Q. Ozonolysis of Q leads to a dicarbonyl compound R, which undergoes intramolecular aldol reaction to give predominantly S.

Section - IV
Matrix- Match Type

This section contains 2 questions. Each question contains statements given in two columns, which have to be matched. The statements in Column I are labelled A, B, C and D, while the statements in Column II are labelled p, q, r, s and t. Any given statement in Column I can have correct matching with ONE OR MORE statement(s) in Column II. The appropriate bubbles corresponding to the Answer:s to these questions have to be darkened as illustrated in the following example.
If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s and t;
Then the correct darkening of bubbles will look like the following.

19. Match each of the diatomic molecules in Column I with its property/properties in Column II.

(D) if R_1 and R_2 are interchanged, magnitude of the power dissipated in R_L will decrease by a factor of 9

Answer:

(B) (A) (D) (C)

52. C_v and C_p Denote the molar specific heat capacities of a gas at constant volume and constant pressure, respectively. Then
(A) C_p - C_v is larger for a diatomic ideal gas than for a monoatomic ideal gas
(B) C_p - C_v is larger for a diatomic ideal gas than for a monoatomic ideal gas
(C) C_p / C_v is larger for a diatomic ideal gas than for a monoatomic ideal gas
(D) C_p . C_v is larger for a diatomic ideal gas than for a monoatomic ideal gas

Answer:

(B) (D) (A) (C)

Comprehension Type

This section contains 2 groups of questions. Each group has 3 multiple choice questions based on a paragraph. Each question has 4 choices (A), (B), (C) and (D) for its Answer; out of which ONLY ONE is correct.

Paragraph for Question No. 53 to 55

Scientists are working hard to develop nuclear fusion reactor. Nuclei of heavy hydrogen, $^1_2\text{H}$, known as deuteron and denoted by D, can be thought of as a candidate for fusion reactor. The D-D reaction is

$$\frac{2}{1}H + \frac{2}{1}H \rightarrow \frac{3}{2}He + n + \text{energy}$$

In the core of fusion reactor, a gas of heavy hydrogen is fully ionized into deuteron nuclei and electrons. This collection of H nuclei and electrons is known as plasma. The nuclei move randomly in the reactor core and occasionally come close enough for nuclear fusion to take place. Usually, the temperatures in the reactor core are too high and no material wall can be used to confine the plasma. Special techniques are used which confine the plasma for a time to befo re the particles fly away from the core. If $n$ is the density (number/volume) of deuterons, the product $nt_0$, is called Lawson number. In one of the criteria, a reactor is termed successful if Lawson number is greater than $5 \times 10^{14} \text{ s/cm}^3$.

It may be helpful to use the following: Boltzmann constant $k = 8.6 \times 10^{-5} \text{ eV/K}$; $\frac{e^2}{4\pi\varepsilon_0} = 1.44 \times 10^{-9} \text{ eVm}$.

53. In the core of nuclear fusion reactor, the gas becomes plasma because of
(A) strong nuclear force acting between the deuterons
(B) Coulomb force acting between the deuterons
(C) Coulomb force acting between deuteron-electron pairs
(D) the high temperature maintained inside the reactor core

Answer:

(A) (B) (C) (D)

54. Assume that two deuteron nuclei in the core of fusion reactor at temperature $T$ are moving towards each other, each with kinetic energy $1.5 \text{ kT}$, when the separation between them is large enough to neglect Coulomb potential energy. Also neglect any interaction from other particles in the core. The minimum temperature $T$ required for them to reach a separation of $4 \times 10^{-15} \text{m}$ is in the range
(A) $1.0 \times 10^9 \text{ K} < T < 2.0 \times 10^9 \text{ K}$
(B) $2.0 \times 10^9 \text{ K} < T < 3.0 \times 10^9 \text{ K}$
(C) $3.0 \times 10^9 \text{ K} < T < 4.0 \times 10^9 \text{ K}$
(D) $4.0 \times 10^9 \text{ K} < T < 5.0 \times 10^9 \text{ K}$
55. Results of calculations for four different designs of a fusion reactor using D-D reaction are given below. Which of these is most promising based on Lawson criterion?
(A) deuteron density = $2.0 \times 10^2$ cm, confinement time = $5.0 \times 10^{-3}$ s
(B) deuteron density = $8.0 \times 10^{14}$ cm, confinement time = $9.0 \times 10^{-1}$ s
(C) deuteron density = $4.0 \times 10^{23}$ cm, confinement time = $1.0 \times 10^{-11}$ s
(D) deuteron density = $1.0 \times 10^{24}$ cm, confinement time = $4.0 \times 10^{-12}$ s

Answer:

Paragraph for Question No. 56 to 58

When a particle is restricted to move along x-axis between $x = 0$ and $x = a$, where a is of nanometer dimension, its energy can take only certain specific values. The allowed energies of the particle moving in such a restricted region, correspond to the formation of standing waves with nodes at its ends $x = 0$ and $x = a$. The wavelength of this standing wave is related to the linear momentum $p$ of the particle according to the de Broglie relation. The energy of the particle of mass $m$ is related to its linear momentum as $E = \frac{p^2}{2m}$. Thus, the energy of the particle can be denoted by a quantum number 'n' taking values 1, 2, 3, . (n = 1, called the ground state) corresponding to the number of loops in the standing wave.

Use the model described above to Answer: the following three questions for a particle moving in the line $x = 0$ to $x = a$. Take $h = 6.6 \times 10^{-34}$ Js and $e = 1.6 \times 10^{-19}$ C.

56. The allowed energy for the particle for a particular value of n is proportional to
(A) $a^2$
(B) $a^{3/2}$
(C) $a^1$
(D) $a^2$

Answer:
57. If the mass of the particle is \( m = 1.0 \times 10^{-30} \text{ kg} \) and \( a = 6.6 \text{ nm} \), the energy of the particle in its ground state is closest to
(A) 0.8 meV
(B) 8 meV
(C) 80 meV
(D) 800 meV

Answer:

58. The speed of the particle, that can take discrete values, is proportional to
(A) \( n^{-3/2} \)
(B) \( n^{-1} \)
(C) \( n^{1/2} \)
(D) \( n \)

Answer:

59. Six point charges, each of the same magnitude \( q \), are arranged in different manners as shown in Column II. In each case, a point M and a line PQ passing through M are shown. Let \( E \) be the electric field and \( V \) be the electric potential at M (potential at infinity is zero) due to the given charge distribution when it is at rest. Now, the whole system is set into rotation with a constant angular velocity about the line PQ. Let \( B \) be the magnetic field at M and \( \mu \) be the magnetic moment of the system in this condition. Assume each rotating charge to be equivalent to a steady current.
