49. **Column I** shows four situations of standard Young's double slit arrangement with the screen placed far away from the slits S₁ and S₂. In each of these cases S₁P₀ = S₂P₀, S₁P₁ - S₂P₁ = λ /4 and S₁P₂ - S₂P₂ = λ /3, where λ is the wavelength of the light used. In the cases B, C and D, a transparent sheet of refractive index μ and thickness t is pasted on slit S₂. The thicknesses of the sheets are different in different cases. The phase difference between the light waves reaching a point P on the screen from the two slits is denoted by δ(P) and the intensity by I(P). Match each situation given in **Column I** with the statement(s) in **Column II** valid for that situation.

SECTION - IV
Integer Answer: Type

This section contains 8 questions. The Answer: to each of the questions is a single digit integer, ranging from 0 to 9. The appropriate bubbles below the respective question numbers in the ORS have to be darkened. For example, if the correct Answer:s to question numbers X, Y, Z and W (say) are 6, 0, 9 and 2, respectively, then the correct darkening of bubbles will look like the following.

50. A metal rod AB of length 10x has its one end A in ice at 0°C and the other end B in water at 100°C. If a point P on the rod is maintained at 400°C, then it is found that equal amounts of water and ice evaporate and melt per unit time. The latent heat of evaporation of water is 540 cal/g and latent heat of melting of ice is 80 cal/g. If the point P is at a distance of λx from the ice end A, find the value of λ. [Neglect any heat loss to the surrounding.]

51. A cylindrical vessel of height 500 mm has an orifice (small hole) at its bottom. The orifice is initially closed and water is filled in it up to height H. Now the top is completely sealed with a cap and the orifice at the bottom is opened. Some water comes out from the orifice and the water level in the vessel becomes steady with height of water column being 200 mm. Find the fall in height (in mm) of water level due to opening of the orifice.

[Take atmospheric pressure = 1.0 x 10^5 N/m^2, density of water 1000 kg/m^3 and g = 10 m/s^2. Neglect any effect of surface tension.]
52. Two soap bubbles A and B are kept in a closed chamber where the air is maintained at pressure 8 N/m². The radii of bubbles A and B are 2 cm and 4 cm, respectively. Surface tension of the soap-water used to make bubbles is 0.04 N/m. Find the ratio \( n_B/n_A \), where \( n_A \) and \( n_B \) are the number of moles of air in bubbles A and B, respectively. [Neglect the effect of gravity.]

53. Three objects A, B and C are kept in a straight line on a frictionless horizontal surface. These have masses \( m \), 2\( m \) and \( m \), respectively. The object A moves towards B with a speed 9 m/s and makes an elastic collision with it. Thereafter, B makes completely inelastic collision with C. All motions occur on the same straight line. Find the final speed (in m/s) of the object C.

55. A light inextensible string that goes over a smooth fixed pulley as shown in the figure connects two blocks of masses 0.36 kg and 0.72 kg. Taking \( g = 10 \text{ m/s}^2 \), find the work done (in joules) by the string on the block of mass 0.36 kg during the first second after the system is released from rest.

56. A solid sphere of radius R has a charge Q distributed in its volume with a charge density \( \rho = kr^a \), where \( k \) and \( a \) are constants and \( r \) is the distance from its centre. If the electric field at \( r = R/2 \) is \( 1/8 \) times that at \( r = R \), find the value of \( a \).

Answer:

\[ \boxed{2} \]

57. A 20 cm long string, having a mass of 1.0 g, is fixed at both the ends. The tension in the string is 0.5 N. The string is set into vibrations using an external vibrator of frequency 100 Hz. Find the separation (in cm) between the successive nodes on the string.
