Marking Scheme

PHYSICS (SUBJECT CODE 042)

(PAPER CODE – 55/1/2)

General Instructions: -

1. You are aware that evaluation is the most important process in the actual and correct assessment of the candidates. A small mistake in evaluation may lead to serious problems which may affect the future of the candidates, education system and teaching profession. To avoid mistakes, it is requested that before starting evaluation, you must read and understand the spot evaluation guidelines carefully. **Evaluation is a 10-12 days mission for all of us. Hence, it is necessary that you put in your best efforts in this process.**
2. Evaluation is to be done as per instructions provided in the Marking Scheme. It should not be done according to one's own interpretation or any other consideration. Marking Scheme should be strictly adhered to and religiously followed. **However, while evaluating, answers which are based on latest information or knowledge and/or are innovative, they may be assessed for their correctness otherwise and marks be awarded to them.**
3. The Head-Examiner must go through the first five answer books evaluated by each evaluator on the first day, to ensure that evaluation has been carried out as per the instructions given in the Marking Scheme. The remaining answer books meant for evaluation shall be given only after ensuring that there is no significant variation in the marking of individual evaluators.
4. Evaluators will mark(\checkmark) wherever answer is correct. For wrong answer 'X' be marked. Evaluators will not put right kind of mark while evaluating which gives an impression that answer is correct and no marks are awarded. This is most common mistake which evaluators are committing.
5. If a question has parts, please award marks on the right-hand side for each part. Marks awarded for different parts of the question should then be totaled up and written in the left-hand margin and encircled. This may be followed strictly.
6. If a question does not have any parts, marks must be awarded in the left hand margin and encircled. This may also be followed strictly
7. If a student has attempted an extra question, answer of the question deserving more marks should be retained and the other answer scored out.
8. No marks to be deducted for the cumulative effect of an error. It should be penalized only once.
9. A full scale of marks 0-70 has to be used. Please do not hesitate to award full marks if the answer deserves it.
10. Every examiner has to necessarily do evaluation work for full working hours i.e. 8 hours every day and evaluate 20 / 25 answer books per day.
11. Ensure that you do not make the following common types of errors committed by the Examiner in the past:-
 - Leaving answer or part thereof unassessed in an answer book.
 - Giving more marks for an answer than assigned to it.
 - Wrong transfer of marks from the inside pages of the answer book to the title page.
 - Wrong question wise totaling on the title page.
 - Wrong totaling of marks of the two columns on the title page.
 - Wrong grand total.
 - Marks in words and figures not tallying.
 - Wrong transfer of marks from the answer book to online award list.
 - Answers marked as correct, but marks not awarded. (Ensure that the right tick mark is correctly and clearly indicated. It should merely be a line. Same is with the X for incorrect answer.)
 - Half or a part of answer marked correct and the rest as wrong, but no marks awarded.

12. While evaluating the answer books if the answer is found to be totally incorrect, it should be marked as (X) and awarded zero (0)Marks.
13. Any unassessed portion, non-carrying over of marks to the title page, or totaling error detected by the candidate shall damage the prestige of all the personnel engaged in the evaluation work as also of the Board. Hence, in order to uphold the prestige of all concerned, it is again reiterated that the instructions be followed meticulously and judiciously.
14. The Examiners should acquaint themselves with the guidelines given in the Guidelines for spot Evaluation before starting the actual evaluation.
15. Every Examiner shall also ensure that all the answers are evaluated, marks carried over to the title page, correctly totaled and written in figures and words.
16. The Board permits candidates to obtain photocopy of the Answer Book on request in an RTI application and also separately as a part of the re-evaluation process on payment of the processing charges.

$$E_{+q} = \frac{1}{4\pi\epsilon_0} \frac{q}{(r^2 + a^2)}$$

$$E_{-q} = \frac{1}{4\pi\epsilon_0} \frac{q}{(r^2 + a^2)}$$

$$E = E_{+q} \cos\theta + E_{-q} \cos\theta$$

$$= 2E_{+q} \cos\theta$$

$$= \frac{2qa}{4\pi\epsilon_0 (r^2 + a^2)^{3/2}}$$

OR

Diagram	1/2
Expression for torque	1/2
Expression for P.E.	1/2
Minimum value of P.E.	1/2

$$\text{Torque } \tau = pE \sin\theta$$

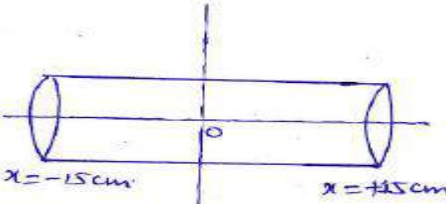

$$P.E. = W = \int_{\theta_0}^{\theta} pE \sin\theta \, d\theta$$

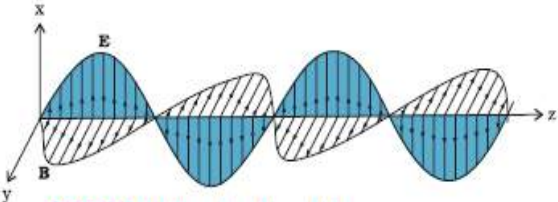

$$= -pE (\cos\theta - \cos\theta_0)$$

$$= -pE \cos\theta \quad (\text{for } \theta_0 = \pi/2)$$

$$\therefore \text{Minimum value of P.E.} = -pE$$

[Note: Award the last 1/2 mark even if the student quotes zero (0) as the minimum value of P.E. which corresponds to the choice $\theta_0 = 0$ (or writes that this cannot be precisely specified as it depends on the choice of θ_0)]

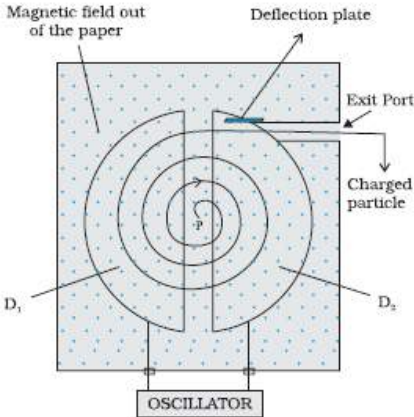

7.	<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> Diagram ½ Formula for flux ½ Calculation of Net outward flux 1 </div> <div style="text-align: center; margin-bottom: 10px;">  </div> <p>Flux = $\int \vec{E} \cdot \vec{ds}$</p> <p>[Alternatively $\phi = \int E ds \cos\theta$]</p> <p>Net outward flux</p> $= [200 \times \pi \times (\frac{5}{100})^2 + 200 \times \pi \times (\frac{5}{100})^2]$ $= \pi \text{ Nm}^2\text{C}^{-1} (\cong 3.142 \text{ Nm}^2\text{C}^{-1})$ <p>[Note: Award full 2 marks even if the students does a direct (correct) calculation of the net outward flux without drawing the diagram or writing the formula for flux. SECTION - C

13.	(a) Reason for circular motion 1 Expression for radius 1 (b) Path of the particle when $\Theta \neq 90^\circ$ 1		
	(a) $\vec{F} = q(\vec{v} \times \vec{B})$ Force \vec{F} on a moving charged particle in a magnetic field acts perpendicular to the velocity vector at all instants. It therefore, changes only the direction of velocity without changing its magnitude. This results in a circular motion of the particle for which the force \vec{F} provides the needed centripetal force $(= \frac{mv^2}{r})$	1/2	
	Here $F = qvB \sin \Theta$ $= qvB$ (as $\Theta = \pi/2$)		
	$\therefore \frac{mv^2}{r} = qvB$	1/2	
	$\therefore r = \frac{mv}{qB}$	1/2	
	(b) If $\Theta \neq 90^\circ$, then velocity will have a component along \vec{B} also and the charged particle will move along \vec{B} with this component of velocity while describing circular motion in a plane perpendicular to \vec{B} . Its motion is, therefore, helical.	1	3
	[Note: Award this 1 mark even if a student just writes that the charged particle will describe a helical path / motion.]		
	OR		
	Diagram 1 Working Principle 1 Two uses 1/2 + 1/2		

	 <p>Working Principle: Cyclotron uses crossed electric and magnetic fields. Magnetic field makes the charged particle describe a circular path while electric field frequency is so adjusted as to accelerate the particle whenever it crosses the space between the dees. A relatively small electric field can then be used to accelerate particles to very high energy values.</p> <p>Uses: (i) To accelerate charged particles to very high energies (ii) To implant ions into solids to modify their properties. Labeled Diagram	1
Working	½
Limitations	½
How the limitations are overcome in a reflecting telescope	1

Working

The objective forms a real image of a distant object at its second focal point. The eyepiece magnifies this image producing a final inverted image.

½

Limitations

It needs large sized lenses which are expensive and very heavy, difficult to make and tend to have chromatic and spherical aberrations and distortions

½

(Award this ½ mark if the student writes any one of these limitations)

Reflecting telescopes

Reflecting telescopes can overcome these limitations because the mirrors used in them

- (i) are free from chromatic aberration and can have very little spherical aberration.
- (ii) are less heavy and easier to support.

½ + ½

19.

(a) Name and Principle of the device	½ + ½
(b) Circuit diagram	1
Working	½
(c) I- V characteristics	½

(a)

Zener diode is used as a voltage regulator

It works on the principle that after the breakdown voltage V_Z , a large change in the reverse current can be produced by an almost insignificant change in the reverse bias voltage

½

Alternatively: The Zener Voltage remains constant, even when the current through the Zener diode varies over a wide range.

½

(b)

1

If the input voltage increases the current through R_s and Zener diode also increases. This increases the voltage drop across R_s without any change in the voltage across the Zener diode. If input voltage decreases, the current through R_s and Zener diode decreases. The voltage across R_s decreases without any change in voltage across the Zener diode.

1/2

1/2

AC Current Gain $\beta_{ac} = \left(\frac{\Delta I_C}{\Delta I_B} \right)_{V_{CE}}$

1/2

3

22.

- | | |
|--|---|
| (a) Highest energy level to which atom will be excited | 1 |
| (b) Calculation of longest Lyman wavelength | 1 |
| (c) Calculation of longest Balmer wavelength | 1 |

(a) Maximum Energy that the excited hydrogen atom can have is
 $E = -13.6\text{eV} + 12.5\text{eV} = -1.1\text{eV}$

$$\text{Now } E_3 = \frac{-13.6}{3^2} \text{eV} = -1.5\text{eV} \quad (< (-1.1\text{eV}))$$

$$E_4 = \frac{-13.6}{4^2} \text{eV} = -0.85\text{eV} \quad (> (-1.1\text{eV}))$$

It follows that the electron can only be excited up to the $n=3$ state.

(b) Longest wavelength of Lyman series:

$$\frac{1}{\lambda_L} = R \left[\frac{1}{1^2} - \frac{1}{2^2} \right] = R \cdot \frac{3}{4}$$

$$\begin{aligned} \therefore \lambda_L &= \frac{4}{3} \times \frac{1}{R} \\ &= \frac{4}{3 \times 1.1 \times 10^7} \text{m} \cong 1218 \text{Å} \end{aligned}$$

Longest wavelength of Balmer series:

$$\frac{1}{\lambda_B} = R \left[\frac{1}{2^2} - \frac{1}{3^2} \right]$$

$$= \frac{5R}{36}$$

$$\lambda_B = \left(\frac{36}{5 \times 1.1 \times 10^7} \right) \text{m} \approx 6560 \text{Å}$$

		1/2	3				

SECTION - D

25.

(a) Derivation of the expression for the average power	3
(b) Definition of terms (i) watt less current (ii) Quality factor	1 + 1

(a) Power at any instant 't'

$$P = Vi$$

$$= (V_m \sin wt)(i_m \sin(wt + \varphi))$$

1/2

$$= \frac{V_m i_m}{2} (2 \sin wt \sin(wt + \varphi))$$

1/2

$$= \frac{V_m i_m}{2} [\cos \varphi - \cos(2wt + \varphi)]$$

1/2

The term $\cos(2wt + \varphi)$ is time dependent and its average over a cycle is zero. Therefore average power

1/2

$$\bar{P} = \frac{V_m i_m}{2} \cos \varphi$$

1/2

$$\bar{P} = \frac{V_m i_m}{\sqrt{2}\sqrt{2}} \cos \varphi$$

$$\bar{P} = V_{rms} i_{rms} \cos \varphi$$

1/2

(b) (i) When no power is dissipated even though a current is flowing in the circuit, the current is then called a wattless current.

Alternatively

The net power dissipation in a circuit containing an ideal inductor or a capacitor is zero. Therefore, the associated current is wattless current.

1

(ii) Q factor of LCR circuit is defined as the ratio of its resonant angular frequency (ω_0) to the band width ($2\Delta\omega$) of the circuit.

Alternatively

$$Q = \frac{\omega_0}{2\Delta\omega}$$

Alternatively

$$Q = \frac{\omega_0 L}{R}$$

Alternatively

Quantity factor is the ratio of rms voltage drop across inductor or the capacitor, in resonance condition, to the rms voltage applied to the circuit.

$$Q = \frac{(V_{rms})_L [(V_{rms})_C]}{(V_{rms})_R}$$

Alternatively

Quantity factor is measure of the sharpness of the resonance in LCR circuit.

Alternatively

$$Q = \frac{1}{R} \sqrt{\frac{L}{C}}$$

5

OR

(a) Statement of Faraday's Laws	1
(b) Derivation of the expression for the emf induced across the ends of a straight conductor	2
(c) Derivation of Magnetic energy stored	2

(a) (i) Whenever there is a change in magnetic flux linked with a coil, an emf is induced in the coil, however it lasts so long as magnetic flux keeps on changing.

(ii) The magnitude of the induced emf is equal to the rate of change of magnetic flux through the circuit

Alternatively

$$\varepsilon = \frac{-d\phi}{dt}$$

1

(b)

1/2

Straight conductor PQ of length 'l' is moving with velocity 'v' in uniform magnetic field B, which is perpendicular to the plane of the system.

Length RQ=x, RS=PQ=l

Instantaneous flux= (normal) field × area

The magnetic flux (ϕ_B) enclosed by the loop PQRS,

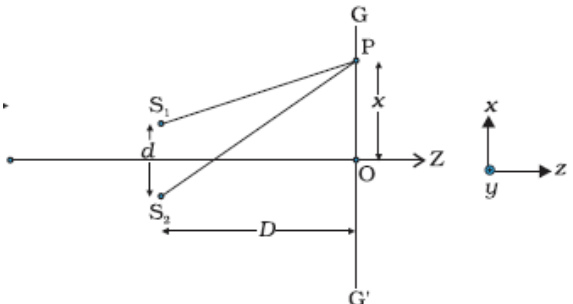

1/2

$$\therefore \phi_B = Blx$$

Since 'x' is changing with time, there is a change of magnetic flux. The rate of change of this magnetic flux determines the induced emf

$$\begin{aligned} \therefore e &= \frac{-d\phi}{dt} = \frac{-d}{dt} (Blx) \\ &= -Bl \frac{dx}{dt} \end{aligned}$$

(a) (i) Parallel

$$Q_1 = C_1 V,$$

$$Q_2 = C_2 V,$$

$$Q_3 = C_3 V,$$

But $Q = Q_1 + Q_2 + Q_3$

$$\therefore Q = C_1 V + C_2 V + C_3 V$$

$$\therefore CV = C_1 V + C_2 V + C_3 V$$

$$C = C_1 + C_2 + C_3$$

1/2

1/2

1/2

(ii) Series

1/2

Potential difference across the plates of the three capacitors are:

$$V_1 = \frac{Q}{C_1}$$

$$V_2 = \frac{Q}{C_2}$$

$$V_3 = \frac{Q}{C_3}$$

But $V = V_1 + V_2 + V_3$

$$V = \frac{Q}{C_1} + \frac{Q}{C_2} + \frac{Q}{C_3}$$

$$\therefore \frac{Q}{C} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3}$$

$$\therefore \frac{1}{C_{eq}} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3}$$

(b) Potential difference across the capacitor of $4\mu\text{f}$ capacitance

$$V = \frac{Q}{C} = \frac{16\mu\text{C}}{4\mu\text{F}} = 4\text{V}$$

Potential across $12\mu\text{f}$ capacitor
 $= 12\text{ V} - 4\text{V}$
 $= 8\text{V}$

Energy stored on this capacitor

$$U = \frac{1}{2} CV^2$$

$$= \frac{1}{2} (12 \times 10^{-6}) 8^2 \text{ joule}$$

$$= 6 \times 64 \times 10^{-6} \text{ joule}$$

$$= 384 \times 10^{-6} \text{ J}$$

$$= 384 \mu\text{J}$$

5

The point P is inside the spherical shell. The Gaussian surface is a sphere through P centered at 'O'

1/2

Flux through this surface = $E \times 4\pi r^2$

1/2

However there is no charge enclosed by this Gaussian surface. Hence using Gauss's Law

$$E \times 4\pi r^2 = 0$$

$$\Rightarrow E = 0$$

1/2

Outside

1/2

1/2

To calculate Electric Field \vec{E} at the outside point P, we take the Gaussian surface to be a sphere of radius 'r' and with center O, passing through P.

Electric Flux through the Gaussian surface

$$\phi = E \times 4\pi r^2$$

Charge enclosed by this the Gaussian surface = $\sigma \times 4\pi R^2$

By Gauss's Law

$$E \times 4\pi r^2 = \frac{\sigma \times 4\pi R^2}{\epsilon_0} = \frac{q}{\epsilon_0}$$

Where q = total charge on the spherical shell.

1/2

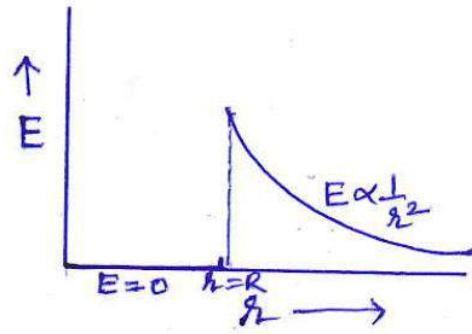

$$\therefore E = \frac{q}{4\pi\epsilon_0 r^2}$$

$$\vec{E} = \frac{1}{4\pi\epsilon_0} \frac{q}{r^2} \hat{r}$$

(b)
