

## EXERCISE 20.2

### Question. 1

**Solution:**

Let us assume that  $I = \int_2^4 \frac{x}{x^2+1} dx$

Then,  $\int \frac{x}{x^2+1} dx = \frac{1}{2} \int \frac{2x}{x^2+1} dx$

$$\frac{1}{2} \log(1+x^2) = F(x)$$

We know that, by the second fundamental theorem of calculus, we get

$$\begin{aligned} I &= F(4) - F(2) \\ &= \frac{1}{2} [\log(1+4^2) - \log(1+2^2)] \\ &= \frac{1}{2} [\log 17 - \log 5] \end{aligned}$$

We know that,  $\log a - \log b = \log(a/b)$

$$\begin{aligned} \text{So,} \\ &= \frac{1}{2} \log(17/5) \end{aligned}$$

### Question. 2

**Solution:**

Let us assume  $1 + \log x = t$

Then differentiating w.r.t.  $x$ , we get

$$(1/x) dx = dt$$

Now substitute  $x = 1$

$$t = 1$$

Again substitute  $x = 2$

$$t = 1 + \log 2$$

Then given question becomes,

$$\begin{aligned} \int_1^2 \frac{1}{x(1+\log x)^2} dx &= \int_1^{1+\log 2} \frac{dt}{t^2} \\ &= \left[ \frac{-1}{t} \right]_1^{1+\log 2} \\ &= \left[ \frac{-1}{1+\log 2} + 1 \right] \end{aligned}$$

Now applying limits, we get,

$$\begin{aligned} &= [(-1 + 1 + \log 2)/(1 + \log 2)] \\ &= [\log 2/(\log e + \log 2)] \quad \dots \text{ [because } \log e = 1 \text{]} \end{aligned}$$

We know that,  $\log a + \log b = \log ab$   
 $= \log 2/\log 2e$

Therefore,  $\int_1^2 \frac{1}{x(1+\log x)^2} dx = \frac{\log 2}{\log 2e}$

### Question. 3

#### Solution:

Let us assume that  $9x^2 - 1 = t$

Then, differentiating w.r.t. x, we get,

$$18x dx = dt$$

Dividing both side by 6, we get

$$3x dx = dt/6$$

So, substitute  $x = 1$

$$t = 8$$

Again substitute  $x = 2$

$$t = 35$$

Then, given question becomes,

$$\begin{aligned} \int_1^2 \frac{3x}{9x^2 - 1} dx &= \int_8^{35} \frac{dt}{6t} \\ &= \frac{1}{6} [\log t]_8^{35} \end{aligned}$$

Now applying limits, we get,

$$= 1/6 (\log 35 - \log 8)$$

We know that,  $\log a - \log b = \log (a/b)$

So,

$$\int_1^2 \frac{3x}{9x^2 - 1} dx = 1/6 \log (35/8)$$

### Question. 6

#### Solution:

Let us assume that,  $e^x = t$

Then, differentiating w.r.t. x, we get,

$$e^x dx = dt$$

So, substitute  $x = 0$

$$t = 1$$

Again substitute  $x = 1$

$$t = e$$

Then, the given question becomes,

$$\int_0^1 \frac{e^x}{1+e^{2x}} dx = \int_1^e \frac{dt}{1+t^2}$$

$$= [\tan^{-1} t]_1^e$$

By applying limits, we get,  
 $= [\tan^{-1} e - \tan^{-1} 1]$

We know that,  $\tan \frac{\pi}{4} = 1$

Then,

$$= \tan^{-1} e - \pi/4$$

Therefore,  $\int_0^1 \frac{e^x}{1+e^{2x}} dx = \tan^{-1} e - \frac{\pi}{4}$

### Question. 7

**Solution:**

Let us assume that,  $x^2 = t$

Then, differentiating w.r.t. x, we get,

$$2x dx = dt$$

So, substitute  $x = 0$

$$t = 0$$

Again substitute  $x = 1$

$$t = 1$$

Then, the given question becomes,

$$\int_0^1 x e^{x^2} dx = \int_0^1 \frac{e^t dt}{2}$$

$$= \frac{1}{2} \int_0^1 e^t dt$$

$$= \frac{1}{2} [e^t]_0^1$$

By applying limits, we get,

$$= \frac{1}{2} [e^1 - e^0]$$

$$= \frac{1}{2} [e - 1]$$

Therefore,  $\int_0^1 x e^{x^2} dx = \frac{1}{2} (e - 1)$
