

1. Find if the following points lie on the given line or not:

(i) (1, 3) on the line $2x + 3y = 11$

Solution:-

From the question it is given that,

Point = (1, 3)

Line = $2x + 3y = 11$

Now, put $x = 1$ and $y = 3$

$$\begin{aligned}\text{Consider Left Hand Side (LHS)} &= 2x + 3y \\ &= 2(1) + 3(3) \\ &= 2 + 9 \\ &= 11\end{aligned}$$

Right Hand Side (RHS) = 11

By comparing LHS and RHS

$$\text{LHS} = \text{RHS}$$

$$11 = 11$$

Therefore, point lie on the given line.

(ii) (5, 3) on the line $3x - 5y + 5 = 0$

Solution:-

From the question it is given that,

Point = (5, 3)

Line = $3x - 5y + 5 = 0$

Now, put $x = 5$ and $y = 3$

$$\begin{aligned}\text{Consider Left Hand Side (LHS)} &= 3x - 5y + 5 \\ &= 3(5) - 5(3) + 5 \\ &= 15 - 15 + 5 \\ &= 5\end{aligned}$$

Right Hand Side (RHS) = 0

By comparing LHS and RHS

$$\text{LHS} \neq \text{RHS}$$

$$5 \neq 0$$

Therefore, point does not lie on the given line.

(iii) (2, 4) on the line $y = 2x - 1$

Solution:-

From the question it is given that,

Point = (2, 4)

$$\text{Line} = y = 2x - 1$$

Now, put $x = 2$ and $y = 4$

Consider Left Hand Side (LHS) = 4

$$\begin{aligned}\text{Right Hand Side (RHS)} &= 2x - 1 \\ &= 2(2) - 1 \\ &= 4 - 1 \\ &= 3\end{aligned}$$

By comparing LHS and RHS

$$\text{LHS} \neq \text{RHS}$$

$$4 \neq 3$$

Therefore, point does not lie on the given line.

(iv) (-1, 5) on the line $3x = 2y - 13$

Solution:-

From the question it is given that,

Point = (-1, 5)

$$\text{Line} = 3x = 2y - 15$$

Now, put $x = -1$ and $y = 5$

$$\begin{aligned}\text{Consider Left Hand Side (LHS)} &= 3x \\ &= 3(-1) \\ &= -3\end{aligned}$$

$$\begin{aligned}\text{Right Hand Side (RHS)} &= 2y - 13 \\ &= 2(5) - 15 \\ &= 10 - 13 \\ &= -3\end{aligned}$$

By comparing LHS and RHS

$$\text{LHS} = \text{RHS}$$

$$-3 = -3$$

Therefore, point lie on the given line.

(v) (7, -2) on the line $5x + 7y = 11$

Solution:-

From the question it is given that,

Point = (7, -2)

$$\text{Line} = 5x + 7y = 11$$

Now, put $x = 7$ and $y = -2$

$$\text{Consider Left Hand Side (LHS)} = 5x + 7y$$

$$\begin{aligned} &= 5(7) + 7(-2) \\ &= 35 - 14 \\ &= 21 \end{aligned}$$

Right Hand Side (RHS) = 11

By comparing LHS and RHS

$$\text{LHS} \neq \text{RHS}$$

$$21 \neq 11$$

Therefore, point does not lie on the given line.

2. Find the value of m if the line $2x + 5y + 12 = 0$ passes through the point (4, m)

Solution:-

From the question it is given that,

The line $2x + 5y + 12 = 0$ passes through the point (4, m)

We have to find the value of m,

So, put $x = 4$ and $y = m$

$$2x + 5y + 12 = 0$$

$$2(4) + 5(m) + 12 = 0$$

$$8 + 5m + 12 = 0$$

$$5m + 20 = 0$$

$$5m = -20$$

$$m = -20/5$$

$$m = -4$$

Therefore, the value of m is -4 .

3. Find the value of P if the line $3y = 5x - 7$ passes through the point (p, 6).

Solution:-

From the question it is given that,

The line $3y = 5x - 7$ passes through the point (p, 6)

We have to find the value of p,

So, put $x = p$ and $y = 6$

$$3y = 5x - 7$$

$$3(6) = 5(P) - 7$$

$$18 = 5P - 7$$

$$18 + 7 = 5P$$

$$25 = 5P$$

$$P = 25/5$$

$$P = 5$$

Therefore, the value of P is 5.

4. Find the value of a if the line $4x = 11 - 3y$ passes through the point (a, 5).

Solution:-

From the question it is given that,

The line $4x = 11 - 3y$ passes through the point (a, 5)

We have to find the value of a,

So, put $x = a$ and $y = 5$

$$4x = 11 - 3y$$

$$4(a) = 11 - 3(5)$$

$$4a = 11 - 15$$

$$4a = -4$$

$$a = -4/4$$

$$a = -1$$

Therefore, the value of a is -1.

5. The line $y = 6 - 3x/2$ passes through the point (r, 3). Find the value of r.

Solution:-

From the question it is given that,

The line $y = 6 - 3x/2$ passes through the point (r, 3)

We have to find the value of r,

So, put $x = r$ and $y = 3$

$$y = 6 - 3x/2$$

$$3 = 6 - (3(r))/2$$

$$3 = (12 - 3r)/2$$

$$6 = 12 - 3r$$

$$3r = 12 - 6$$

$$3r = 6$$

$$r = 6/3$$

$$r = 2$$

Therefore, the value of r is 2.

6. The line $(3 + 5y)/2 = (4x - 7)/3$ passes through the point (1, k). find the value of k

Solution:-

From the question it is given that,

The line $(3 + 5y)/2 = (4x - 7)/3$ passes through the point (1, k)

We have to find the value of k,

So, put $x = 1$ and $y = k$

$$(3 + 5y)/2 = (4x - 7)/3$$

$$(3 + 5(k))/2 = (4(1) - 7)/3$$

$$3(3 + 5k) = 2(4 - 7)$$

$$9 + 15k = 2(-3)$$

$$9 + 15k = -6$$

$$15k = -6 - 9$$

$$15k = -15$$

$$k = -15/15$$

$$k = -1$$

Therefore, the value of k is -1 .

7. The line $4x + 3y = 11$ bisects the join of $(6, m)$ and $(4, 9)$. Find the value of m .

Solution:-

Let us assume the point of intersection of CD and line $4x + 3y = 11$ be the point $Q(a, b)$

From the question it is given that, line $4x + 3y = 11$ bisects the line segment CD,

So, $CQ: QD = 1: 1$

Then, the coordinates of Q are,

$$Q(a, b) = Q\left[\left(\frac{6 + 4}{2}\right), \left(\frac{m + 9}{2}\right)\right]$$

$$= Q\left[5, \left(\frac{m + 9}{2}\right)\right]$$

Since $Q(a, b)$ lies on the line $4x + 3y = 11$,

Where, $x = 5$, $y = (m + 9)/2$

$$4(5) + 3\left(\frac{m + 9}{2}\right) = 11$$

$$20 + \frac{3m + 27}{2} = 11$$

$$40 + 3m + 27 = 22$$

$$3m + 67 = 22$$

$$3m = 22 - 67$$

$$3m = -45$$

$$m = -45/3$$

$$m = -15$$

Therefore, value of m is -15 .

8. The line $2x - 5y + 31 = 0$ bisects the join of $(-4, 5)$ and $(p, 9)$. Find the value of p .

Solution:-

Let us assume the point of intersection of CD and line $2x - 5y + 31 = 0$ be the point $Q(a, b)$

From the question it is given that, line $2x - 5y + 31 = 0$ bisects the line segment CD,

So, $CQ: QD = 1: 1$

Then, the coordinates of Q are,

$$\begin{aligned}Q(a, b) &= Q\left[\frac{(-4 + P)}{2}, \frac{(5 + 9)}{2}\right] \\ &= Q\left[\frac{(-4 + P)}{2}, 7\right]\end{aligned}$$

Since Q(a, b) lies on the line $2x - 5y + 31 = 0$,

Where, $x = \frac{(-4 + P)}{2}$, $y = 7$

$$2\left(\frac{-4 + P}{2}\right) - 5(7) + 31 = 0$$

$$(-8 + 2P)/2 - 35 + 31 = 0$$

$$(-8 + 2P)/2 - 4 = 0$$

$$-8 + 2P - 8 = 0$$

$$-16 + 2P = 0$$

$$2P = 16$$

$$P = 16/2$$

$$P = 8$$

Therefore, value of P is 8.

9. The line segment formed by the points (3, 7) and (-7, Z) is bisected by the line $3x + 4y = 18$. Find the value of z.

Solution:-

Let us assume the point of intersection of CD and line $3x + 4y = 18$ be the point Q(a, b)

From the question it is given that, line $3x + 4y = 18$ bisects the line segment CD,

So, CQ: QD = 1: 1

Then, the coordinates of Q are,

$$\begin{aligned}Q(a, b) &= Q\left[\frac{(-3 + 7)}{2}, \frac{(7 + z)}{2}\right] \\ &= Q[-2, \frac{(7 + z)}{2}]\end{aligned}$$

Since Q(a, b) lies on the line $3x + 4y = 18$,

Where, $x = -2$, $y = \frac{(7 + z)}{2}$

$$3x + 4y = 18$$

$$3(-2) + 4\left(\frac{7 + z}{2}\right) = 18$$

$$-6 + (28 + 4z)/2 = 18$$

$$-12 + 28 + 4z = 36$$

$$16 + 4z = 36$$

$$4z = 36 - 16$$

$$4z = 20$$

$$z = 20/4$$

$$z = 5$$

Therefore, value of z is 5.

10. The line $5x - 3y + 1 = 0$ divides the join of $(2, m)$ and $(7, 9)$ in the ratio 2: 3. Find the value of m .

Solution:-

Let us assume the point of intersection of CD and line $5x - 3y + 1 = 0$ be the point $Q(a, b)$
 From the question it is given that, line $5x - 3y + 1 = 0$ divides the line segment CD are in the ratio 2: 3,

So, $CQ: QD = 2: 3$

So, Point C become $3(2, m) = (6, 3m)$

D become $2(7, 9) = (14, 18)$

Then, the coordinates of Q are,

$$\begin{aligned} Q(a, b) &= Q\left[\frac{(14 + 6)}{5}, \frac{(18 + 3m)}{5}\right] \\ &= Q\left[4, \frac{(18 + 3m)}{5}\right] \end{aligned}$$

Since $Q(a, b)$ lies on the line $5x - y + 1 = 0$,

Where, $x = 4$, $y = (18 + 3m)/5$

$$5x - 3y + 1 = 0$$

$$5(4) - 3\left(\frac{18 + 3m}{5}\right) + 1 = 0$$

$$20 - \frac{(54 + 9m)}{5} + 1 = 0$$

$$21 - \frac{(54 + 9m)}{5} = 0$$

$$105 - 54 - 9m = 0$$

$$51 - 9m = 0$$

$$9m = 51$$

$$m = 51/9$$

$$m = 17/3 \quad \dots \text{ [because divide both by 3]}$$

Therefore, value of m is $17/3$.

11. The line $7x - 8y = 4$ divides the join of $(-8, -4)$ and $(6, k)$ in the ratio 2: 5. Find the value of k .

Solution:-

Let us assume the point of intersection of CD and line $7x - 8y = 4$ be the point $Q(a, b)$

From the question it is given that, line $7x - 8y = 4$ divides the line segment CD are in the ratio 2: 5,

So, $CQ: QD = 2: 5$

So, Point C become $5(-8, -4) = (-40, -20)$

D become $2(6, k) = (12, 2k)$

Then, the coordinates of Q are,

$$\begin{aligned} Q(a, b) &= Q\left[\frac{(12 - 40)}{7}, \frac{(2k - 20)}{7}\right] \\ &= Q\left[-4, \frac{(2k - 20)}{7}\right] \end{aligned}$$

Since $Q(a, b)$ lies on the line $7x - 8y = 4$,

Where, $x = -4$, $y = (2k - 20)/7$

$$7(-4) - 8((2k - 20)/7) = 4$$

$$-28 - (16k - 160)/7 = 4$$

$$-196 - 16k + 160 = 28$$

$$-36 - 16k = 28$$

$$16k = -36 - 28$$

$$16k = -64$$

$$k = -64/16$$

$$k = -4$$

Therefore, value of k is -4 .

12. The line $5x + 3y = 25$ divides the join of $(b, 4)$ and $(5, 8)$ in the ratio $1:3$. Find the value of b .

Solution:-

Let us assume the point of intersection of CD and line $5x + 3y = 25$ be the point $Q(a, b)$

From the question it is given that, line $5x + 3y = 25$ divides the line segment CD in the ratio $1:3$,

So, $CQ:QD = 1:3$

So, Point C become $3(b, 4) = (3b, 12)$

D become $1(5, 8) = (5, 8)$

Then, the coordinates of Q are,

$$Q(a, b) = Q\left[\frac{(5 + 3b)}{4}, \frac{(8 + 12)}{4}\right]$$

$$= Q\left[\frac{(5 + 3b)}{4}, 5\right]$$

Since $Q(a, b)$ lies on the line $5x + 3y = 25$,

Where, $x = (5 + 3b)/4$, $y = 5$

$$5\left(\frac{5 + 3b}{4}\right) + 3(5) = 25$$

$$\frac{25 + 15b}{4} + 15 = 25$$

$$25 + 15b + 60 = 100$$

$$15b + 85 = 100$$

$$15b = 100 - 85$$

$$15b = 15$$

$$b = 15/15$$

$$b = 1$$

Therefore, value of b is 1 .

13. P is a point on the line segment AB dividing it in the ratio $2:3$. If the coordinates of

A and B are $(-2, 3)$ and $(8, 8)$, find if P lies on the line $7x - 2y = 4$.

Solution:-

From the question it is given that,

The coordinates of A and B are $(-2, 3)$ and $(8, 8)$

The line segment AB dividing it in the ratio 2: 3

So, AP: PB = 2: 3

Then, A = $3(-2, 3) = (-6, 9)$

B = $2(8, 8) = (16, 16)$

Then, the coordinates of P are,

$$\begin{aligned} P(a, b) &= P\left[\frac{(16 - 6)}{5}, \frac{(16 + 9)}{5}\right] \\ &= P[2, 5] \end{aligned}$$

Since P(a, b) lies on the line $7x - 2y = 4$,

Where, $x = 2$, $y = 5$

$$\begin{aligned} \text{Consider Left Hand Side (LHS)} &= 7x - 2y \\ &= 7(2) - 2(5) \\ &= 14 - 10 \\ &= 4 \end{aligned}$$

Right Hand Side (RHS) = 4

By comparing LHS and RHS

$$\text{LHS} = \text{RHS}$$

$$4 = 4$$

Therefore, point P(2, 5) lie on the given line $7x - 2y = 4$.

14. L is a point on the line segment PQ dividing it in the ratio 1: 3. If the coordinates of P and Q are $(3, 7)$ and $(11, -5)$ respectively, find if L lies on the line $2x + 5y = 20$.

Solution:-

From the question it is given that,

The coordinates of P and Q are $(3, 7)$ and $(11, -5)$ respectively

The line segment PQ dividing it in the ratio 1: 3

So, LP: LQ = 1: 3

Then, P = $3(3, 7) = (9, 21)$

Q = $1(11, -5) = (11, -5)$

Then, the coordinates of L are,

$$\begin{aligned} L(a, b) &= L\left[\frac{(11 + 9)}{4}, \frac{(-5 + 21)}{4}\right] \\ &= L[5, 4] \end{aligned}$$

Since L(a, b) lies on the line $2x + 5y = 20$,

Where, $x = 5$, $y = 4$

$$\begin{aligned}\text{Consider Left Hand Side (LHS)} &= 2x + 5y \\ &= 2(5) + 5(4) \\ &= 10 + 20 \\ &= 30\end{aligned}$$

$$\text{Right Hand Side (RHS)} = 20$$

By comparing LHS and RHS

$$\text{LHS} \neq \text{RHS}$$

$$30 \neq 20$$

Therefore, point L(a, b) does not lie on the given line $2x + 5y = 20$.

15. The line segment formed by two points A(2, 3) and B(5, 6) is divided by a point in the ratio 1: 2. Find, whether the point of intersection lies on the line $3x - 4y + 5 = 0$.

Solution:-

From the question it is given that,

The coordinates of A(2, 3) and B(5, 6).

The line segment AB dividing it in the ratio 1: 2

So, AL: LB = 1: 2

$$\text{Then, } A = 2(2, 3) = (4, 6)$$

$$B = 1(5, 6) = (5, 6)$$

Then, the coordinates of L are,

$$L(a, b) = L\left[\left(\frac{5 + 4}{3}\right), \left(\frac{6 + 6}{3}\right)\right]$$

$$= L[3, 4]$$

Since L(a, b) lies on the line $3x - 4y + 5 = 0$,

Where, $x = 3$, $y = 4$

$$\begin{aligned}\text{Consider Left Hand Side (LHS)} &= 3x - 4y + 5 \\ &= 3(3) - 4(4) + 5 \\ &= 9 - 16 + 5 \\ &= -2\end{aligned}$$

$$\text{Right Hand Side (RHS)} = 0$$

By comparing LHS and RHS

$$\text{LHS} \neq \text{RHS}$$

$$-2 \neq 0$$

Therefore, point L(a, b) does not lie on the given line $3x - 4y + 5 = 0$.
