## EXERCISE 8.1 PAGE NO: 89

Choose the correct answer from the given four options:

- 1. If  $\cos A = 4/5$ , then the value of  $\tan A$  is
  - (A) 3/5
- **(B)**  $\frac{3}{4}$
- (C) 4/3
- (D) 5/3

**Solution:** 

(B) 3/4

According to the question,

$$\cos A = 4/5 ...(1)$$

We know,

tan A = sinA/cosA

To find the value of sin A,

We have the equation,

$$\sin^2\theta + \cos^2\theta = 1$$

So, 
$$\sin \theta = \sqrt{(1-\cos^2 \theta)}$$

Then,

$$\sin A = \sqrt{(1-\cos^2 A)...(2)}$$

$$\sin^2 A = 1 - \cos^2 A$$

$$\sin A = \sqrt{(1-\cos^2 A)}$$

Substituting equation (1) in (2),

We get,

Sin A = 
$$\sqrt{(1-(4/5)^2)}$$
  
=  $\sqrt{(1-(16/25))}$   
=  $\sqrt{(9/25)}$   
=  $\sqrt[3]{4}$ 

Therefore,

$$tan A = \frac{3}{5} \times \frac{5}{4} = \frac{3}{4}$$

- 2. If  $\sin A = \frac{1}{2}$ , then the value of  $\cot A$  is
  - (A)  $\sqrt{3}$  (B)  $1/\sqrt{3}$  (C)  $\sqrt{3/2}$  (D) 1

**Solution:** 

(A) 
$$\sqrt{3}$$

According to the question,

Sin A = 
$$\frac{1}{2}$$
 ... (1)

We know that,

$$\cot A = \frac{1}{\tan A} = \frac{\cos A}{\sin A} \dots (2)$$

To find the value of cos A.

We have the equation,

$$\sin^2 \theta + \cos^2 \theta = 1$$

So, 
$$\cos \theta = \sqrt{(1-\sin^2 \theta)}$$

Then,

$$\cos A = \sqrt{(1-\sin^2 A) \dots (3)}$$

$$\cos^2 A = 1-\sin^2 A$$

$$\cos A = \sqrt{(1-\sin^2 A)}$$

Substituting equation 1 in 3, we get,

$$\cos A = \sqrt{(1-1/4)} = \sqrt{(3/4)} = \sqrt{3/2}$$
  
Substituting values of sin A and cos A in equation 2, we get  $\cot A = (\sqrt{3/2}) \times 2 = \sqrt{3}$ 

3. The value of the expression [cosec  $(75^{\circ} + \theta) - \sec (15^{\circ} - \theta) - \tan (55^{\circ} + \theta) + \cot (35^{\circ} - \theta)$ ] is

$$(A)-1$$

**Solution:** 

(B) 0

According to the question,

We have to find the value of the equation,

$$\begin{aligned} &\cos(75^{\circ}+\theta) - \sec(15^{\circ}-\theta) - \tan(55^{\circ}+\theta) + \cot(35^{\circ}-\theta) \\ &= \csc[90^{\circ}-(15^{\circ}-\theta)] - \sec(15^{\circ}-\theta) - \tan(55^{\circ}+\theta) + \cot[90^{\circ}-(55^{\circ}+\theta)] \end{aligned}$$

Since, cosec  $(90^{\circ} - \theta) = \sec \theta$ 

And,  $\cot(90^{\circ}-\theta) = \tan \theta$ 

We get,

= 
$$\sec(15^{\circ}-\theta) - \sec(15^{\circ}-\theta) - \tan(55^{\circ}+\theta) + \tan(55^{\circ}+\theta)$$
  
= 0

4. Given that  $sin\theta = a b$ , then  $cos\theta$  is equal to

(A) 
$$b/\sqrt{(b^2-a^2)}$$

(C) 
$$\sqrt{(b^2-a^2)/b}$$

**(D)** 
$$a/\sqrt{(b^2-a^2)}$$

**Solution:** 

(C) 
$$\sqrt{(b^2-a^2)/b}$$

According to the question,

$$\sin \theta = a/b$$

We know,  $\sin^2 \theta + \cos^2 \theta = 1$ 

$$\sin^2 A = 1 - \cos^2 A$$

$$\sin A = \sqrt{1-\cos^2 A}$$

So, 
$$\cos \theta = \sqrt{(1-a^2/b^2)} = \sqrt{((b^2-a^2)/b^2)} = \sqrt{(b^2-a^2)/b^2}$$

b Hence, 
$$\cos \theta = \sqrt{(b^2 - a^2)/b}$$

5. If  $\cos (\alpha + \beta) = 0$ , then  $\sin (\alpha - \beta)$  can be reduced to

**Solution:** 

(B)  $\cos 2\beta$ 

According to the question,

$$\cos(\alpha + \beta) = 0$$

Since, 
$$\cos 90^{\circ} = 0$$

We can write,

$$\cos(\alpha + \beta) = \cos 90^{\circ}$$

By comparing cosine equation on L.H.S and R.H.S,

We get,

$$(\alpha + \beta) = 90^{\circ}$$

$$\alpha = 90^{\circ}$$
- $\beta$ 

Now we need to reduce  $\sin (\alpha - \beta)$ ,

So, we take,

$$\sin(\alpha-\beta) = \sin(90^{\circ}-\beta-\beta) = \sin(90^{\circ}-2\beta)$$

$$\sin(90^{\circ}-\theta) = \cos \theta$$

So, 
$$\sin(90^{\circ}-2\beta) = \cos 2\beta$$

Therefore, 
$$sin(\alpha-\beta) = cos 2\beta$$

6. The value of  $(\tan 1^{\circ} \tan 2^{\circ} \tan 3^{\circ} ... \tan 89^{\circ})$  is

(A) 0

**(B)** 1

(C) 2

(D)  $\frac{1}{2}$ 

**Solution:** 

tan 1°. tan 2°.tan 3° ..... tan 89°

= tan1°.tan 2°.tan 3°...tan 43°.tan 44°.tan 45°.tan 46°.tan 47°...tan 87°.tan 88°.tan 89°

Since,  $\tan 45^{\circ} = 1$ .

= tan1°.tan 2°.tan 3°...tan 43°.tan 44°.1.tan 46°.tan 47°...tan 87°.tan 88°.tan 89°

 $= \tan 1^{\circ} \cdot \tan 2^{\circ} \cdot \tan 3^{\circ} \cdot \tan 43^{\circ} \cdot \tan 44^{\circ} \cdot 1 \cdot \tan(90^{\circ} - 44^{\circ}) \cdot \tan(90^{\circ} - 43^{\circ}) \cdot \tan(90^{\circ} - 3^{\circ}) \cdot \tan(90$ 

 $2^{\circ}$ ).tan( $90^{\circ}$ - $1^{\circ}$ )

Since,  $tan(90^{\circ}-\theta) = \cot \theta$ ,

= tan1°.tan 2°.tan 3°...tan 43°.tan 44°.1.cot 44°.cot 43°...cot 3°.cot 2°.cot 1°

Since,  $\tan \theta = (1/\cot \theta)$ 

 $= \tan 1^{\circ} \cdot \tan 2^{\circ} \cdot \tan 3^{\circ} \cdot \cot 43^{\circ} \cdot \tan 44^{\circ} \cdot 1$ . (1/tan 44°). (1/tan 43°)... (1/tan 3°). (1/tan 2°). (1/tan 1°)

= 
$$(\tan 1^{\circ} \times \frac{1}{\tan 1^{\circ}}). (\tan 2^{\circ} \times \frac{1}{\tan 2^{\circ}}) ... (\tan 44^{\circ} \times \frac{1}{\tan 44^{\circ}})$$

= 1

Hence,  $\tan 1^{\circ}$ . $\tan 2^{\circ}$ . $\tan 3^{\circ}$ .....  $\tan 89^{\circ} = 1$ 

7. If  $\cos 9\alpha = \sin \alpha$  and  $9\alpha < 90^{\circ}$ , then the value of  $\tan 5\alpha$  is

(A)  $1/\sqrt{3}$ 

**(B)**  $\sqrt{3}$ 

(C) 1

 $(\mathbf{D}) \mathbf{0}$ 

**Solution:** 

(C) 1

According to the question,

 $\cos 9 \propto = \sin \propto \text{ and } 9 \propto < 90^{\circ}$ 

i.e.  $9\alpha$  is an acute angle

We know that,

 $\sin(90^{\circ}-\theta) = \cos\theta$ 

So,

 $\cos 9 \propto = \sin (90^{\circ} - \propto)$ 

Since,  $\cos 9\alpha = \sin(90^{\circ}-9\alpha)$  and  $\sin(90^{\circ}-\alpha) = \sin\alpha$ 

Thus,  $\sin (90^{\circ}-9\propto) = \sin \propto$ 

 $90^{\circ}-9 \propto = \propto$ 

 $10 \propto = 90^{\circ}$ 

 $\propto = 9^{\circ}$ 

Substituting  $\propto 9^{\circ}$  in tan  $5 \propto$ , we get,

 $\tan 5 \propto = \tan (5 \times 9) = \tan 45^{\circ} = 1$ 

 $\therefore$ , tan  $5 \propto 1$ 

### **EXERCISE 8.2**

**PAGE NO: 93** 

Write 'True' or 'False' and justify your answer in each of the following: 1. tan 47°/cot 43  $^{\circ}$  = 1 Solution:

True

Justification: Since,  $\tan (90^\circ - \theta) = \cot \theta$  $\frac{\tan 47^\circ}{\cot 43^\circ} = \frac{\tan (90^\circ - 43^\circ)}{\cot 43^\circ}$   $\frac{\tan 47^\circ}{\cot 43^\circ} = \frac{\cot 43^\circ}{\cot 43^\circ} = 1$   $\frac{\tan 47^\circ}{\cot 43^\circ} = 1$ 

2. The value of the expression  $(\cos^2 23^\circ - \sin^2 67^\circ)$  is positive. Solution:

```
False 

<u>Justification:</u>
Since, (a^2-b^2) = (a+b)(a-b)
\cos^2 23^\circ - \sin^2 67^\circ = (\cos 23^\circ + \sin 67^\circ)(\cos 23^\circ - \sin 67^\circ)
= [\cos 23^\circ + \sin(90^\circ - 23^\circ)] [\cos 23^\circ - \sin(90^\circ - 23^\circ)]
= (\cos 23^\circ + \cos 23^\circ)(\cos 23^\circ - \cos 23^\circ) (\because \sin(90^\circ - \theta) = \cos \theta)
= (\cos 23^\circ + \cos 23^\circ).0
= 0, which is neither positive nor negative
```

3. The value of the expression (sin  $80^{\circ}$  – cos  $80^{\circ}$ ) is negative. Solution:

```
False
```

Justification:

We know that,  $\sin \theta \text{ increases when } 0^\circ \le \theta \le 90^\circ \\ \cos \theta \text{ decreases when } 0^\circ \le \theta \le 90^\circ \\ \text{And } (\sin 80^\circ\text{-}\cos 80^\circ) = (\text{increasing value-decreasing value}) \\ = a \text{ positive value.} \\ \text{Therefore, } (\sin 80^\circ\text{-}\cos 80^\circ) > 0.$ 

4.  $\sqrt{(1-\cos^2\theta)\sec^2\theta}$  = tan  $\theta$ 

**Solution:** 

True

Justification:

LHS: 
$$\sqrt{((1-\cos^2\theta)\sec^2\theta)}$$
  
=  $\sqrt{\sin^2\theta}\sec^2\theta$   
(:  $\sin^2\theta + \cos^2\theta = 1 \Rightarrow \sin^2\theta = 1 - \cos^2\theta$ )  
=  $\sqrt{\frac{\sin^2\theta}{\cos^2\theta}}$  (Since,  $\sec^2\theta = \frac{1}{\cos^2\theta}$ )  
=  $\frac{\sin\theta}{\cos\theta}$   
=  $\tan\theta$   
= RHS

## 5. If $\cos A + \cos^2 A = 1$ , then $\sin^2 A + \sin^4 A = 1$ . Solution:

True

#### Justification:

According to the question,

 $\cos A + \cos^2 A = 1$ 

i.e.,  $\cos A = 1 - \cos^2 A$ 

Since,

 $\sin^2 \theta + \cos^2 \theta = 1$ 

$$\sin^2\theta = 1 - \cos^2\theta)$$

We get,

 $\cos A = \sin^2 A \dots (1)$ 

Squaring L.H.S and R.H.S,

 $\cos^2 A = \sin^4 A \dots (2)$ 

To find  $\sin^2 A + \sin^4 A = 1$ 

Adding equations (1) and (2),

We get

 $\sin^2 A + \sin^4 A = \cos A + \cos^2 A$ 

Therefore,  $\sin^2 A + \sin^4 A = 1$ 

## 6. $(\tan \theta + 2) (2 \tan \theta + 1) = 5 \tan \theta + \sec^2 \theta$ . Solution:

False

#### Justification:

L.H.S = 
$$(\tan \theta + 2) (2 \tan \theta + 1)$$
  
=  $2 \tan^2 \theta + \tan \theta + 4 \tan \theta + 2$   
=  $2 \tan^2 \theta + 5 \tan \theta + 2$   
Since,  $\sec^2 \theta - \tan^2 \theta = 1$ , we get,  $\tan^2 \theta = \sec^2 \theta - 1$   
=  $2(\sec^2 \theta - 1) + 5 \tan \theta + 2$   
=  $2 \sec^2 \theta - 2 + 5 \tan \theta + 2$   
=  $5 \tan \theta + 2 \sec^2 \theta \neq R.H.S$   
 $\therefore$ , L.H.S  $\neq R.H.S$ 

### **EXERCISE 8.3**

**PAGE NO: 95** 

Prove the following (from Q.1 to Q.7): 1.  $\sin \theta/(1+\cos \theta) + (1+\cos \theta)/\sin \theta = 2\csc \theta$ Solution:

L.H.S=
$$\frac{\sin \theta}{1 + \cos \theta} + \frac{1 + \cos \theta}{\sin \theta}$$
Taking the L.C.M of the denominators,
We get,
$$= \frac{\sin^2 \theta + (1 + \cos \theta)^2}{(1 + \cos \theta).\sin \theta}$$

$$= \frac{\sin^2 \theta + 1 + \cos^2 \theta + 2\cos \theta}{(1 + \cos \theta).\sin \theta}$$
Since,  $\sin^2 \theta + \cos^2 \theta = 1$ 

$$= \frac{1 + 1 + 2\cos \theta}{(1 + \cos \theta).\sin \theta}$$

$$= \frac{2 + 2\cos \theta}{(1 + \cos \theta).\sin \theta}$$

$$= \frac{2(1 + \cos \theta).\sin \theta}{(1 + \cos \theta).\sin \theta}$$
Since,  $1/\sin \theta = \csc \theta$ 

$$= \frac{2}{\sin \theta} = 2 \csc \theta$$
R.H.S
Hence proved.

## 2. tan A/(1+secA) - tan A/(1-secA) = 2cosec A Solution:

L.H.S:

$$\frac{\tan A}{1 + \sec A} - \frac{\tan A}{1 - \sec A}$$
Taking LCM of the denominators,
$$= \frac{\tan A(1 - \sec A) - \tan A(1 + \sec A)}{(1 + \sec A)(1 - \sec A)}$$
Since,  $(1 + \sec A)(1 - \sec A) = 1 - \sec^2 A$ 

$$= \frac{\tan A(1 - \sec A - 1 - \sec A)}{1 - \sec^2 A}$$

$$= \frac{\tan A(-2 \sec A)}{1 - \sec^2 A}$$

$$= \frac{2 \tan A \cdot \sec A}{\sec^2 A - 1}$$
Since,
$$\sec^2 A - \tan^2 A = 1$$

$$\sec^2 A - 1 = \tan^2 A$$

$$= \frac{2 \tan A \cdot \sec A}{\tan^2 A}$$
Since, sec A = (1/\cos A) and tan A = (\sin A/\cos A)
$$= \frac{2 \sec A}{\tan A} = \frac{2 \cos A}{\cos A \sin A}$$

$$= \frac{2}{\sin A}$$
= 2 \cosec A (:\frac{1}{\sin A} = \cosec A)
= R.H.S
Hence proved.

#### 3. If $\tan A = \frac{3}{4}$ , then $\sin A \cos A = \frac{12}{25}$ **Solution:**

According to the question,

 $\tan A = \frac{3}{4}$ 

We know,

tan A = perpendicular/ base

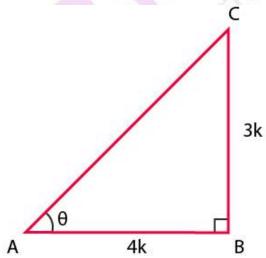

So,

 $\tan A = 3k/4k$ 

Where,

Perpendicular = 3k

Base = 4k

Using Pythagoras Theorem,  $(hypotenuse)^2 = (perpendicular)^2 + (base)^2$   $(hypotenuse)^2 = (3k)^2 + (4k)^2 = 9k^2 + 16k^2 = 25k^2$ 

hypotenuse = 5k

To find sin A and cos A,

$$\begin{aligned} &\sin A \,=\, \frac{perpendicular}{hypotenuse} \,=\, \frac{3\,k}{5\,k} \,=\, \frac{3}{5} \\ &\cos A \,=\, \frac{base}{hypotenuse} \,=\, \frac{4\,k}{5\,k} \,=\, \frac{4}{5} \end{aligned}$$

Multiplying sin A and cos A

$$\sin A \cos A = \frac{3}{5} \times \frac{4}{5} = \frac{12}{25}$$

Hence, proved.

#### 4. $(\sin \alpha + \cos \alpha) (\tan \alpha + \cot \alpha) = \sec \alpha + \csc \alpha$ **Solution:**

L.H.S:

$$(\sin \alpha + \cos \alpha) (\tan \alpha + \cot \alpha)$$

As we know,

$$\tan A = \frac{\sin A}{\cos A}$$

$$\cot A = \frac{\cos A}{\sin A}$$

$$= (\sin \alpha + \cos \alpha) \left( \frac{\sin \alpha}{\cos \alpha} + \frac{\cos \alpha}{\sin \alpha} \right)$$

$$= (\sin \alpha + \cos \alpha) \left( \frac{\sin^2 \alpha + \cos^2 \alpha}{\sin \alpha \cos \alpha} \right)$$

$$[\because \sin^2 \alpha + \cos^2 \alpha = 1]$$

$$= (\sin \alpha + \cos \alpha) \left(\frac{1}{\sin \alpha \cos \alpha}\right)$$

$$= \frac{\sin \alpha}{\sin \alpha \cos \alpha} + \frac{\cos \alpha}{\sin \alpha \cos \alpha}$$
$$= \frac{1}{\cos \alpha} + \frac{1}{\sin \alpha}$$

$$=\frac{1}{\cos\alpha}+\frac{1}{\sin\alpha}$$

$$= \sec \alpha + \csc \alpha \left[\because \frac{1}{\cos \alpha} = \sec \alpha \text{ and } \frac{1}{\sin \alpha} = \csc \alpha\right]$$

$$= R.H.S$$

Hence, proved.

## 5. $(\sqrt{3}+1)(3-\cot 30^\circ)=\tan^3 60^\circ-2\sin 60^\circ$

**Solution:** 

L.H.S: 
$$(\sqrt{3} + 1) (3 - \cot 30^{\circ})$$

$$= (\sqrt{3} + 1) (3 - \sqrt{3}) [\because \cos 30^{\circ} = \sqrt{3}]$$
  
=  $(\sqrt{3} + 1) \sqrt{3} (\sqrt{3} - 1) [\because (3 - \sqrt{3}) = \sqrt{3} (\sqrt{3} - 1)]$ 

$$= ((\sqrt{3})^2 - 1) \sqrt{3} \left[ \because (\sqrt{3} + 1)(\sqrt{3} - 1) = ((\sqrt{3})^2 - 1) \right]$$

$$=(3-1)\sqrt{3}$$

$$=2\sqrt{3}$$

Similarly solving R.H.S: 
$$\tan^3 60^\circ - 2 \sin 60^\circ$$

Since, 
$$\tan 60^{\circ} = \sqrt{3}$$
 and  $\sin 60^{\circ} = \sqrt{3/2}$ ,

We get,

$$(\sqrt{3})^3 - 2.(\sqrt{3}/2) = 3\sqrt{3} - \sqrt{3}$$
  
=  $2\sqrt{3}$ 

Therefore, L.H.S = R.H.S Hence, proved.

#### 6. $1 + (\cot^2 \alpha/1 + \csc \alpha) = \csc \alpha$ Solution:

Since,

$$\cot^2 \alpha = \frac{\cos^2 \alpha}{\sin^2 \alpha}$$
 and  $\csc \alpha = \frac{1}{\sin \alpha}$ 

We get.

$$1 + \frac{\cot^2 \alpha}{1 + \csc \alpha} = 1 + \frac{\cos^2 \alpha/\sin^2 \alpha}{1 + 1/\sin \alpha}$$

$$= 1 + \frac{\cos^2 \alpha/\sin^2 \alpha}{\frac{\sin \alpha + 1}{\sin \alpha}}$$

$$= 1 + \frac{\cos^2 \alpha}{\sin \alpha(1 + \sin \alpha)}$$

$$\sin \alpha + \sin^2 \alpha + \cos^2 \alpha$$

And, we know that,

$$\sin^{2} \alpha + \cos^{2} \alpha = 1$$

$$= \frac{1 + \sin \alpha}{\sin \alpha (1 + \sin \alpha)}$$
Since,

 $\sin \alpha + \sin^2 \alpha$ 

$$\frac{\frac{1}{\sin \alpha}}{\sin \alpha} = \csc \alpha$$

$$= \frac{1}{\sin \alpha} = \csc \alpha$$

$$= R.H.S$$

#### 7. $\tan \theta + \tan (90^{\circ} - \theta) = \sec \theta \sec (90^{\circ} - \theta)$ Solution:

Since, 
$$\tan (90^{\circ} - \theta) = \cot \theta$$
  
 $\tan \theta + \tan (90^{\circ} - \theta) = \tan \theta + \cot \theta$ 

$$= \frac{\sin \theta}{\cos \theta} + \frac{\cos \theta}{\sin \theta}$$
$$= \frac{\sin^2 \theta + \cos^2 \theta}{\sin \theta \cos \theta}$$

$$\sin^{2}\theta + \cos^{2}\theta = 1$$

$$= \frac{1}{\sin\theta\cos\theta}$$

$$= \frac{1}{\cos\theta} \times \frac{1}{\sin\theta}$$

$$= \sec\theta \csc\theta$$

#### Since,

cosec 
$$\theta$$
 = sec (90° -  $\theta$ )  
= sec  $\theta$  sec (90° -  $\theta$ )  
= R.H.S

Hence, proved.

### **EXERCISE 8.4**

**PAGE NO: 99** 

## 1. If $cosec\theta + cot\theta = p$ , then prove that $cos\theta = (p^2 - 1)/(p^2 + 1)$ . Solution:

According to the question,

$$\csc \theta + \cot \theta = p$$

Since,

$$cosec \theta = \frac{1}{\sin \theta} \& \cot \theta = \frac{\cos \theta}{\sin \theta}$$

$$\frac{1}{\sin\theta} + \frac{\cos\theta}{\sin\theta} = p$$

$$\frac{1+\cos\theta}{\sin\theta} = p$$

Squaring on L.H.S and R.H.S,

$$\left(\frac{1+\cos\theta}{\sin\theta}\right)^2 = p^2$$

$$\frac{\frac{1+\cos^2\theta+2\cos\theta}{\sin^2\theta}}{\sin^2\theta} = p^2$$

Applying component and dividend rule,

$$\frac{(1+\cos^2\theta+2\cos\theta)-\sin^2\theta}{(1+\cos^2\theta+2\cos\theta)+\sin^2\theta}\,=\,\frac{p^2-1}{p^2+1}$$

$$\frac{(1-\sin^2\theta)+\cos^2\theta+2\cos\theta}{\sin^2\theta+\cos^2\theta+1+2\cos\theta} = \frac{p^2-1}{p^2+1}$$

Since,

$$1 - \sin^2 \theta = \cos^2 \theta \& \sin^2 \theta + \cos^2 \theta = 1$$

$$\frac{\cos^2\theta + \cos^2\theta + 2\cos\theta}{1 + 1 + 2\cos\theta} = \frac{p^2 - 1}{p^2 + 1}$$

$$\frac{2\cos^2\theta + 2\cos\theta}{2 + 2\cos\theta} = \frac{p^2 - 1}{p^2 + 1}$$

$$\frac{2 \, \cos \theta \, (\cos \theta + 1)}{2 \, (\cos \theta + 1)} \, = \, \frac{p^2 - 1}{p^2 + 1}$$

$$\cos\theta = \frac{p^2 - 1}{p^2 + 1}$$

Hence, proved.

## 2. Prove that $\sqrt{(\sec^2 \theta + \csc^2 \theta)} = \tan \theta + \cot \theta$ Solution:

$$\sqrt{(\sec^2\theta + \csc^2\theta)}$$

Since,

$$\sec^{2}\theta = \frac{1}{\cos^{2}\theta} \& \csc^{2}\theta = \frac{1}{\sin^{2}\theta}$$

$$= \sqrt{\frac{1}{\cos^{2}\theta} + \frac{1}{\sin^{2}\theta}}$$

$$= \sqrt{\frac{\sin^{2}\theta + \cos^{2}\theta}{\cos^{2}\theta \sin^{2}\theta}}$$
Since,
$$\sin^{2}\theta + \cos^{2}\theta = 1$$

$$= \sqrt{\frac{1}{\cos^{2}\theta \sin^{2}\theta}}$$

$$= \frac{1}{\cos\theta \sin\theta}$$
Since,
$$1 = \sin^{2}\theta + \cos^{2}\theta$$

$$= \frac{\sin^{2}\theta + \cos^{2}\theta}{\cos\theta \sin\theta}$$

$$= \frac{\sin^{2}\theta + \cos^{2}\theta}{\cos\theta \sin\theta}$$

$$= \frac{\sin^{2}\theta}{\cos\theta \sin\theta} + \frac{\cos^{2}\theta}{\cos\theta \sin\theta}$$
Since,
$$\frac{\sin\theta}{\cos\theta} = \tan\theta \& \frac{\cos\theta}{\sin\theta} = \cot\theta$$

$$= \tan\theta + \cot\theta$$

$$= R.H.S$$
Hence, proved.

3. The angle of elevation of the top of a tower from certain point is  $30^{\circ}$ . If the observer moves 20 metres towards the tower, the angle of elevation of the top increases by  $15^{\circ}$ . Find the height of the tower.

#### **Solution:**

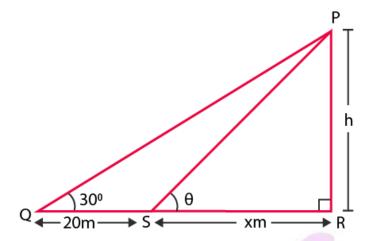

Let PR = h meter, be the height of the tower.

The observer is standing at point Q such that, the distance between the observer and tower is QR = (20+x) m, where

$$\overrightarrow{QR} = \overrightarrow{QS} + \overrightarrow{SR} = 20 + x$$

$$\angle PQR = 30^{\circ}$$

$$\angle PSR = \theta$$

In  $\triangle PQR$ ,

$$\tan 30^{\circ} = \frac{h}{20+x} \left[ \because, \tan \theta \right] = \frac{\text{perpendicular}}{\text{base}}$$
  

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{20+x} \left[ \because, \tan 30^{\circ} \right] = \frac{1}{\sqrt{3}}$$

Rearranging the terms,

We get 
$$20 + x = \sqrt{3}h$$

$$\Rightarrow$$
 x =  $\sqrt{3}$ h – 20 ...eq.1

In  $\triangle PSR$ ,

$$\tan \theta = h/x$$

Since, angle of elevation increases by 15° when the observer moves 20 m towards the tower.

We have,

$$\theta = 30^{\circ} + 15^{\circ} = 45^{\circ}$$

So.

$$\tan 45^{\circ} = h/x$$

$$\Rightarrow 1 = h/x$$

$$\Rightarrow$$
 h = x

Substituting x=h in eq. 1, we get

$$h = \sqrt{3} h - 20$$

$$\Rightarrow \sqrt{3} h - h = 20$$

$$\Rightarrow$$
 h ( $\sqrt{3}$  - 1) = 20

$$\Rightarrow h (\sqrt{3} - 1) = 20$$

$$\Rightarrow h = \frac{20}{\sqrt{3} - 1}$$

Rationalizing the denominator, we have

$$\Rightarrow h = \frac{20}{\sqrt{3}-1} \times \frac{\sqrt{3}+1}{\sqrt{3}+1}$$

$$\Rightarrow h = \frac{20}{\sqrt{3}-1} \times \frac{\sqrt{3}+1}{\sqrt{3}+1}$$
$$\Rightarrow h = \frac{20(\sqrt{3}+1)}{(\sqrt{3}-1)(\sqrt{3}+1)}$$

$$= \frac{20\left(\sqrt{3}+1\right)}{3-1}$$

$$= \frac{20 \left(\sqrt{3}+1\right)}{2}$$

$$= 10 (\sqrt{3} + 1)$$

Hence, the required height of the tower is  $10(\sqrt{3} + 1)$  meter.

## 4. If $1 + \sin^2\theta = 3\sin\theta \cos\theta$ , then prove that $\tan\theta = 1$ or $\frac{1}{2}$ . Solution:

Given:  $1+\sin^2\theta = 3\sin\theta\cos\theta$ Dividing L.H.S and R.H.S equations with  $\sin^2\theta$ , We get,

$$\frac{\frac{1+\sin^2\theta}{\sin^2\theta}}{\frac{1}{\sin^2\theta}} = \frac{\frac{3\sin\theta\cos\theta}{\sin^2\theta}}{\sin^2\theta}$$

$$\Rightarrow \frac{1}{\sin^2\theta} + 1 = \frac{3\cos\theta}{\sin\theta}$$

$$\csc^2 \theta + 1 = 3 \cot \theta$$

Since,

$$\csc^2 \theta - \cot^2 \theta = 1 \Rightarrow \csc^2 \theta = \cot^2 \theta + 1$$

$$\Rightarrow \cot^2 \theta + 1 + 1 = 3 \cot \theta$$

$$\Rightarrow \cot^2 \theta + 2 = 3 \cot \theta$$

$$\Rightarrow \cot^2 \theta - 3 \cot \theta + 2 = 0$$

Splitting the middle term and then solving the equation,

$$\Rightarrow \cot^2 \theta - \cot \theta - 2 \cot \theta + 2 = 0$$

$$\Rightarrow$$
 cot  $\theta$ (cot  $\theta$  -1)-2(cot  $\theta$  +1) = 0

$$\Rightarrow (\cot \theta - 1)(\cot \theta - 2) = 0$$

$$\Rightarrow$$
 cot  $\theta = 1, 2$ 

Since,

$$tan \theta = 1/cot \theta$$

$$\tan \theta = 1, \frac{1}{2}$$

Hence, proved.

## 5. Given that $\sin\theta + 2\cos\theta = 1$ , then prove that $2\sin\theta - \cos\theta = 2$ . Solution:

Given:  $\sin \theta + 2 \cos \theta = 1$ 

Squaring on both sides,

$$(\sin\theta + 2\cos\theta)^2 = 1$$

$$\Rightarrow \sin^2 \theta + 4 \cos^2 \theta + 4 \sin \theta \cos \theta = 1$$

Since,  $\sin^2 \theta = 1 - \cos^2 \theta$  and  $\cos^2 \theta = 1 - \sin^2 \theta$ 

$$\Rightarrow (1 - \cos^2 \theta) + 4(1 - \sin^2 \theta) + 4\sin \theta \cos \theta = 1$$

$$\Rightarrow 1 - \cos^2 \theta + 4 - 4 \sin^2 \theta + 4 \sin \theta \cos \theta = 1$$

$$\Rightarrow -4 \sin^2 \theta - \cos^2 \theta + 4 \sin \theta \cos \theta = -4$$
$$\Rightarrow 4 \sin^2 \theta + \cos^2 \theta - 4 \sin \theta \cos \theta = 4$$

$$a^2 + b^2 - 2ab = (a - b)^2$$

So, we get,

$$(2\sin\theta - \cos\theta)^2 = 4$$

$$\Rightarrow$$
 2sin  $\theta$  – cos  $\theta$  = 2

Hence proved.

6. The angle of elevation of the top of a tower from two points distant s and t from its foot are complementary. Prove that the height of the tower is  $\sqrt{st}$ .

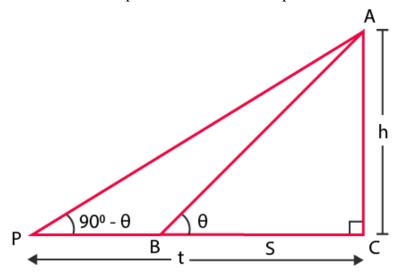

#### **Solution:**

Let BC = s; PC = t

Let height of the tower be AB = h.

$$\angle ABC = \theta$$
 and  $\angle APC = 90^{\circ} - \theta$ 

(: the angle of elevation of the top of the tower from two points P and B are complementary)

$$\begin{array}{l} _{In}\Delta ABC, \tan\theta \,=\, \frac{AC}{BC} \,=\, \frac{h}{s}\,\,...\,eq.\,\,1\,\,[\,\because, \tan\theta \,=\, \frac{perpendicular}{base}] \\ _{In}\Delta APC, \tan(90^{\circ}-\theta) \,\,=\, \frac{AC}{PC} \,=\, \frac{h}{t} \\ \Rightarrow \,\cot\theta \,=\, \frac{h}{t}\,\,...\,eq.\,2 \end{array}$$

Multiplying eq. 1 and eq. 2, we get

$$\tan \theta \times \cot \theta = \frac{h}{s} \times \frac{h}{t}$$

$$\Rightarrow 1 = \frac{h^2}{st} \left[ \because \tan \theta \times \cot \theta = 1 \operatorname{as} \cot \theta = \frac{1}{\tan \theta} \right]$$

$$\Rightarrow$$
 h<sup>2</sup> = st

$$\Rightarrow$$
 h =  $\sqrt{st}$ 

Hence the height of the tower is  $\sqrt{st}$ .

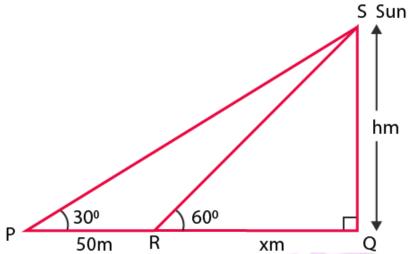

# 7. The shadow of a tower standing on a level plane is found to be 50 m longer when Sun's elevation is $30^{\circ}$ than when it is $60^{\circ}$ . Find the height of the tower. Solution:

Let SQ = h be the tower.

$$\angle SPQ = 30^{\circ} \text{ and } \angle SRQ = 60^{\circ}$$

According to the question, the length of shadow is 50 m long hen angle of elevation of the sun is 30° than when it was 60°. So,

$$PR = 50 \text{ m}$$
 and  $RQ = x \text{ m}$ 

So in  $\Delta$ SRQ, we have

$$\tan 60^{\circ} = \frac{h}{x}$$

$$[\because \tan \theta = \frac{\text{perpendicular}}{\text{base}}$$

$$\Rightarrow \tan 60^\circ = \frac{SQ}{RO}$$

$$\Rightarrow \sqrt{3} = \frac{h}{x} [\because \tan 60^\circ = \sqrt{3}]$$

$$\Rightarrow x = \frac{h}{\sqrt{3}}$$

In  $\Delta SPQ$ ,

$$\tan 30^{\circ} = \frac{h}{50+x}$$

$$[\because \tan 30^\circ = \frac{SQ}{PQ} = \frac{SQ}{PR+PQ}]$$

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{50+x} \left[ \because, \tan 30^\circ = \frac{1}{\sqrt{3}} \right]$$

$$\Rightarrow$$
 50 + x =  $\sqrt{3}$ h

Substituting the value of x in the above equation, we get

$$\Rightarrow$$
 50 +  $\frac{h}{\sqrt{3}}$  =  $\sqrt{3}h$ 

$$\Rightarrow \frac{50\sqrt{3} + h}{\sqrt{3}} = \sqrt{3}h$$

$$\Rightarrow 50\sqrt{3} + h = 3h$$

$$\Rightarrow 50\sqrt{3} = 3h - h$$

$$\Rightarrow$$
 3h - h =  $50\sqrt{3}$ 

$$\Rightarrow 2h = 50\sqrt{3}$$

$$\Rightarrow$$
 h =  $(50\sqrt{3})/2$ 

$$\Rightarrow$$
 h =  $25\sqrt{3}$ 

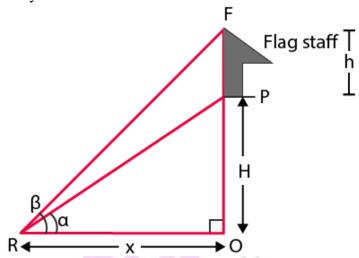

Hence, the required height is  $25\sqrt{3}$  m.

8. A vertical tower stands on a horizontal plane and is surmounted by a vertical flag staff of height

h. At a point on the plane, the angles of elevation of the bottom and the top of the flag staff are a and  $\beta$ , respectively. Prove that the height of the tower is  $[h \tan \alpha/(\tan \beta - \tan \alpha)]$ . **Solution:** 

Given that a vertical flag staff of height h is surmounted on a vertical tower of height H(say), such that FP = h and FO = H.

The angle of elevation of the bottom and top of the flag staff on the plane is  $\angle PRO =$  $\alpha$  and  $\angle$ FRO =  $\beta$  respectively

In  $\triangle$ PRO, we have

$$\tan \alpha = \frac{PO}{RO} = \frac{H}{x}$$

$$[\because \tan \theta = \frac{\text{perpendicular}}{\text{base}}]$$

$$\Rightarrow x = \frac{H}{\tan \alpha} \dots eq. 1$$

And in 
$$\Delta FRO$$
, we have

And in 
$$\Delta FRO$$
, we have  $\tan \beta = \frac{FO}{RO} = \frac{FP+PO}{RO} = \frac{h+H}{x}$ 

$$\Rightarrow x = \frac{h+H}{\tan \beta} \dots eq. 2$$

Comparing eq. 1 and eq. 2,

$$\Rightarrow \frac{H}{\tan \alpha} = \frac{h+H}{\tan \beta}$$

Solving for H.

$$\Rightarrow$$
 H tan β = (h+H) tan α

$$\Rightarrow H \ tan \ \beta - H \ tan \ \alpha = h \ tan \ \alpha$$

$$\Rightarrow$$
 H (tan  $\beta$  – tan  $\alpha$ ) = h tan  $\alpha$ 

$$\Rightarrow H = \frac{h \tan \alpha}{\tan \beta - \tan \alpha}$$

Hence, proved.

9. If  $\tan \theta + \sec \theta = 1$ , then prove that  $\sec \theta = (l^2 + 1)/2l$ . **Solution:** 

Given:  $\tan \theta + \sec \theta = 1 \dots eq. 1$ 

Multiplying and dividing by (sec  $\theta$  – tan  $\theta$ ) on numerator and denominator of L.H.S,

$$\frac{(\sec \theta + \tan \theta)(\sec \theta - \tan \theta)}{\sec \theta - \tan \theta} = 1$$

$$\Rightarrow \frac{\sec^2 \theta - \tan \theta}{\sec^2 \theta - \tan^2 \theta} = 1$$

Since, 
$$\sec^2 \theta - \tan^2 \theta = 1$$

$$\Rightarrow \frac{1}{\sec \theta - \tan \theta} = 1$$

So, 
$$\sec \theta - \tan \theta = 1 \dots \text{eq.} 2$$

$$(\tan \theta + \sec \theta) + (\sec \theta - \tan \theta) = 1$$

$$\Rightarrow 2 \sec \theta = \frac{l^2+1}{l}$$

$$\Rightarrow$$
 sec  $\theta = \frac{l^2+1}{2l}$ 

Hence, proved.
