

## Exercise 2(A)

1. ₹16,000 is invested at 5% compound interest compounded per annum.

Use the table, given below, to find the amount in 4 years.

Year	Initial amount (₹)	Interest (₹)	Final amount
1 <sup>st</sup>	16,000	800	16,800
2 <sup>nd</sup>			
3 <sup>rd</sup>			
4 <sup>th</sup>			
5 <sup>th</sup>			

**Solution:**

Year	Initial amount (₹)	Interest (₹)	Final amount
1 <sup>st</sup>	16,000	800	16,800
2 <sup>nd</sup>	16,800	840	17,640
3 <sup>rd</sup>	17,640	882	18,522
4 <sup>th</sup>	18,522	926.10	19,448.10
5 <sup>th</sup>	19,448.10	972.405	20,420.505

Thus, the amount in 4 years is ₹19,448.10

2.(i) Calculate the amount and the compound interest on:

₹6000 in 3 years at 5% per year.

(ii) Calculate amount and the compound interest on:

₹8000 in 2½ years at 15% per annum.

**Solution:**

(i) Given: P = ₹6,000; N = 3 years and R = 5%

For the 1<sup>st</sup> year

P = ₹6000; N = 1 year and R = 5%

Interest =  $(6000 \times 5 \times 1)/100$   
= ₹300

And, amount = ₹(6000 + 300)  
= ₹6,300

For the 2<sup>nd</sup> year

P = ₹6300; N = 1 year and R = 5%

Interest =  $(6300 \times 5 \times 1)/100$   
= ₹315

And, amount = ₹(6300 + 315)  
= ₹6,615

For the 3<sup>rd</sup> year

P = ₹6,615; N = 1 year and R = 5%

Interest =  $(6615 \times 5 \times 1)/100$   
= ₹330.75

And, amount = ₹(6,615 + 330.75)

$$= ₹6,945.75$$

Hence, the C.I. accrued = Final amount – Initial principal  
 $= ₹6,945.75 - ₹6,000$   
 $= ₹945.75$

(ii) Given:  $P = 8000$ ;  $N = 2\frac{1}{2}$  years and  $R = 15\%$

For the 1<sup>st</sup> year

$P = ₹8,000$ ;  $N = 1$  year and  $R = 15\%$

$$\begin{aligned}\text{Interest} &= (8000 \times 15 \times 1)/100 \\ &= ₹1,200\end{aligned}$$

$$\begin{aligned}\text{And, amount} &= ₹(8,000 + 1,200) \\ &= ₹9,200\end{aligned}$$

For the 2<sup>nd</sup> year

$P = ₹9,200$ ;  $N = 1$  year and  $R = 15\%$

$$\begin{aligned}\text{Interest} &= (9200 \times 15 \times 1)/100 \\ &= ₹1,380\end{aligned}$$

$$\begin{aligned}\text{And, amount} &= ₹(9,200 + 1,380) \\ &= ₹10,580\end{aligned}$$

For the next  $\frac{1}{2}$  year

$P = ₹10,580$ ;  $N = \frac{1}{2}$  year and  $R = 15\%$

$$\begin{aligned}\text{Interest} &= (10580 \times 15 \times \frac{1}{2})/100 \\ &= ₹793.50\end{aligned}$$

$$\begin{aligned}\text{And, amount} &= ₹(10,580 + 793.50) \\ &= ₹11,373.50\end{aligned}$$

Hence, the C.I. accrued = Final amount – Initial principal  
 $= ₹11,373.50 - ₹8,000$   
 $= ₹3,373.50$

**3. Calculate the amount and the compound interest on:**

(i) ₹4,600 in 2 years when the rates of interest of successive years are 10% and 12% respectively.

(ii) ₹6,000 in 3 years, when the rates of the interest for successive years are 10%, 14% and 15% respectively.

**Solution:**

(i) For 1<sup>st</sup> year

$P = ₹4,600$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}I &= (4600 \times 10 \times 1)/100 \\ &= ₹460\end{aligned}$$

And,

$$\begin{aligned}A &= ₹(4,600 + 460) \\ &= ₹5,060\end{aligned}$$

For 2<sup>nd</sup> year

$P = ₹5,060$ ;  $R = 12\%$  and  $T = 1$  year.

$$\begin{aligned} I &= (5060 \times 12 \times 1)/100 \\ &= 60720/100 \\ &= ₹607.20 \end{aligned}$$

And,

$$\begin{aligned} A &= ₹(5,060 + 607.20) \\ &= ₹5,667.20 \end{aligned}$$

$$\begin{aligned} \text{Compound interest} &= ₹(5,667.20 - 4,600) \\ &= ₹1,067.20 \end{aligned}$$

Amount after 2 years = ₹5,667.20

(ii) For 1<sup>st</sup> year

$P = ₹16,000$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned} I &= (16000 \times 10 \times 1)/100 \\ &= ₹1,600 \end{aligned}$$

And,

$$\begin{aligned} A &= ₹(16,000 + 1,600) \\ &= ₹17,600 \end{aligned}$$

For 2<sup>nd</sup> year

$P = ₹17,600$ ;  $R = 14\%$  and  $T = 1$  year

$$\begin{aligned} I &= (17600 \times 14 \times 1)/100 \\ &= 246400/100 \\ &= ₹2,464 \end{aligned}$$

And,

$$\begin{aligned} A &= ₹(17,600 + 2,464) \\ &= ₹20,064 \end{aligned}$$

For 3<sup>rd</sup> year,

$P = ₹20,064$ ;  $R = 15\%$  and  $T = 1$  year

$$\begin{aligned} I &= (20064 \times 15 \times 1)/100 \\ &= ₹3,009.60 \end{aligned}$$

And,

$$\begin{aligned} \text{Amount after 3 years} &= ₹(20,064 + 3,009.60) \\ &= ₹23,073.60 \end{aligned}$$

Hence,

$$\begin{aligned} \text{Compound interest} &= ₹(23,073.60 - 16,000) \\ &= ₹7,073.60 \end{aligned}$$

**4. Find the compound interest, correct to the nearest rupee, on ₹2,400 for 2½ years at 5 per cent per annum.**

**Solution:**

For 1<sup>st</sup> year

$P = ₹2400$ ;  $R = 5\%$  and  $T = 1$  year

$$\begin{aligned}I &= (2400 \times 5 \times 1)/100 \\&= ₹120 \\A &= ₹(2400 + 120) \\&= ₹2520\end{aligned}$$

For 2<sup>nd</sup> year

$$\begin{aligned}P &= ₹2520; R = 5\% \text{ and } T = 1 \text{ year} \\I &= (2520 \times 5 \times 1)/100 \\&= ₹126 \\A &= ₹(2,520 + 126) \\&= ₹2,646\end{aligned}$$

For the final  $\frac{1}{2}$  year

$$\begin{aligned}P &= \text{Rs. } 2646; R = 5\% \text{ and } T = \frac{1}{2} \text{ year} \\I &= (2646 \times 5 \times 1)/(100 \times 2) \\&= ₹66.15 \\ \text{Amount after } 2\frac{1}{2} \text{ years} &= ₹2,646 + ₹66.15 \\&= ₹2,712.15\end{aligned}$$

Hence,

$$\begin{aligned}\text{Compound interest} &= ₹(2,712.15 - 2,400) \\&= ₹312.15\end{aligned}$$

**5. Calculate the compound interest for the second year on ₹8,000 invested for 3 years at 10% per annum.**

**Solution:**

For 1<sup>st</sup> year

$$\begin{aligned}P &= ₹8,000; R = 10\% \text{ and } T = 1 \text{ year} \\I &= (8000 \times 10 \times 1)/100 \\&= 800\end{aligned}$$

And,

$$A = ₹(8,000 + 800) = ₹8,800$$

For 2<sup>nd</sup> year

$$\begin{aligned}P &= ₹8,800; R = 10\% \text{ and } T = 1 \text{ year} \\I &= (8800 \times 10 \times 1)/100 \\&= ₹880\end{aligned}$$

Hence,

$$\text{Compound interest for 2<sup>nd</sup> years} = ₹880$$

**6. A borrowed ₹2,500 from B at 12% per annum compound interest. After 2 years, A gave ₹2,936 and a watch to B to clear the account. Find the cost of the watch.**

**Solution:**

For 1<sup>st</sup> year

$$P = ₹2500; R = 12\% \text{ and } T = 1 \text{ year}$$

$$I = (2500 \times 12 \times 1)/100$$

$$= ₹300$$

And,

$$\text{Amount} = ₹(2,500 + 300) = ₹2,800$$

For 2<sup>nd</sup> year

$$P = ₹2,800; R = 12\% \text{ and } T = 1 \text{ year}$$

$$I = (2800 \times 12 \times 1)/100$$

$$= ₹336$$

And,

$$\text{Amount} = ₹(2,800 + 336) = ₹3136$$

Now,

$$\text{Amount repaid by A to B} = ₹2936$$

$$\text{The amount of watch} = ₹(3136 - 2936) = ₹200$$

**7. How much will ₹50,000 amount to in 3 years, compounded yearly, if the rates for the successive years are 6%, 8% and 10% respectively?**

**Solution:**

$$\text{Given: } P = ₹50,000; T = 3 \text{ years}$$

$$\text{Interest for the 1<sup>st</sup> year, } R = 6\%$$

$$I = (P \times R \times T)/100$$

$$= (50000 \times 6 \times 1)/100$$

$$= ₹3,000$$

And,

$$\text{Amount after the 1<sup>st</sup> year} = ₹(3,000 + 50,000)$$

$$= ₹53,000$$

Now,

$$\text{Interest for the 2<sup>nd</sup> year, } R = 8\% \text{ and } P = ₹53,000$$

$$I = (P \times R \times T)/100$$

$$= (53000 \times 8 \times 1)/100$$

$$= ₹4,240$$

And,

$$\text{Amount after the 2<sup>nd</sup> year} = ₹(4,240 + 53,000)$$

$$= ₹57,240$$

Next,

$$\text{Interest for the 3<sup>rd</sup> year, } R = 10\% \text{ and } P = ₹57,240$$

$$I = (P \times R \times T)/100$$

$$= (57240 \times 10 \times 1)/100$$

$$= ₹5,724$$

And,

$$\text{Amount after the 3<sup>rd</sup> year} = ₹(5,724 + 57,240)$$

$$= ₹62,964$$

Hence, the amount after 3 years will be ₹62,964

**8. Meenal lends ₹75,000 at C.I. for 3 years. If the rate of interest for the first two years is**

15% per year and for the third year it is 16%, calculate the sum Meenal will get at the end of the third year.

**Solution:**

Given:  $P = ₹75,000$ ;  $T = 3$  years

Interest for the 1<sup>st</sup> year,  $R = 15\%$

$$\begin{aligned} I &= (P \times R \times T)/100 \\ &= (75000 \times 15 \times 1)/100 \\ &= ₹11,250 \end{aligned}$$

And,

$$\begin{aligned} \text{Amount after the 1<sup>st</sup> year} &= ₹(75,000 + 11,250) \\ &= ₹86,250 \end{aligned}$$

Now,

Interest for the 2<sup>nd</sup> year,  $R = 15\%$  and  $P = ₹86,250$

$$\begin{aligned} I &= (P \times R \times T)/100 \\ &= (86250 \times 15 \times 1)/100 \\ &= ₹12,937.50 \end{aligned}$$

And,

$$\begin{aligned} \text{Amount after the 2<sup>nd</sup> year} &= ₹(12,937.50 + 86,250) \\ &= ₹99,187.50 \end{aligned}$$

Next,

Interest for the 3<sup>rd</sup> year,  $R = 16\%$  and  $P = ₹99,187.50$

$$\begin{aligned} I &= (P \times R \times T)/100 \\ &= (99187.50 \times 16 \times 1)/100 \\ &= ₹15,870 \end{aligned}$$

And,

$$\begin{aligned} \text{Amount after the 3<sup>rd</sup> year} &= ₹(15,870 + 99,187.50) \\ &= ₹1,15,057.5 \end{aligned}$$

Hence, at the end of 3 years Meenal will get an amount of ₹1,15,057.5

**9. Govind borrows ₹18,000 at 10% simple interest. He immediately invests the money borrowed at 10% compound interest compounded half-yearly. How much money does Govind gain in one year?**

**Solution:**

Calculating the simple interest

$P = ₹18,000$ ;  $R = 10\%$  and  $T = 1$  year, we have

$$\begin{aligned} \text{S.I.} &= (18000 \times 10 \times 1)/100 \\ &= ₹1,800 \end{aligned}$$

Calculating the compound interest (compounded half-yearly)

For 1<sup>st</sup> half- year

$P = ₹18,000$ ;  $R = 10\%$  and  $T = \frac{1}{2}$  year

$$\begin{aligned} \text{Interest} &= (18000 \times 10 \times 1)/(100 \times 2) \\ &= ₹900 \end{aligned}$$

So,

$$\text{Amount} = ₹18,000 + ₹900 = ₹18,900$$

Now,

For 2<sup>nd</sup> half-year

$$P = ₹18,900; R = 10\% \text{ and } T = \frac{1}{2} \text{ year}$$

$$\begin{aligned}\text{Interest} &= (18,900 \times 10 \times 1)/(100 \times 2) \\ &= ₹945 \text{ Rs}\end{aligned}$$

So,

$$\text{Amount} = ₹18,900 + ₹945 = ₹19,845$$

Then,

$$\text{Compound interest} = ₹(19,845 - 18,000) = ₹1,845$$

Therefore,

$$\text{Govind's gain} = ₹(1,845 - 1,800) = ₹45$$

**10. Find the compound interest on ₹4,000 accrued in three years, when the rate of interest is 8% for the first year and 10% per year for the second and the third years.**

**Solution:**

$$\text{Given: } P = ₹4,000; T = 3 \text{ years}$$

$$\text{Interest for the 1<sup>st</sup> year, } R = 8\%$$

$$\begin{aligned}I &= (P \times R \times T)/100 \\ &= (4000 \times 8 \times 1)/100 \\ &= ₹320\end{aligned}$$

And,

$$\begin{aligned}\text{Amount after the 1<sup>st</sup> year} &= ₹(4,000 + 320) \\ &= ₹4,320\end{aligned}$$

Now,

$$\text{Interest for the 2<sup>nd</sup> year, } R = 10\% \text{ and } P = ₹4,320$$

$$\begin{aligned}I &= (P \times R \times T)/100 \\ &= (4320 \times 10 \times 1)/100 \\ &= ₹432\end{aligned}$$

And,

$$\begin{aligned}\text{Amount after the 2<sup>nd</sup> year} &= ₹(432 + 4,320) \\ &= ₹4,752\end{aligned}$$

Next,

$$\text{Interest for the 3<sup>rd</sup> year, } R = 10\% \text{ and } P = ₹4,752$$

$$\begin{aligned}I &= (P \times R \times T)/100 \\ &= (4,752 \times 10 \times 1)/100 \\ &= ₹475.20\end{aligned}$$

And,

$$\begin{aligned}\text{Amount after the 3<sup>rd</sup> year} &= ₹(475.20 + 4,752) \\ &= ₹5,227.20\end{aligned}$$

Hence,

$$\begin{aligned}\text{The compound interest} &= ₹(5227.20 - 4,000) \\ &= ₹1,227.20\end{aligned}$$

### Exercise 2(B)

1. Calculate the difference between the simple interest and the compound interest on ₹4,000 in 2 years at 8% per annum compounded yearly.

**Solution:**

For 1<sup>st</sup> year

$P = ₹4,000$ ;  $R = 8\%$  and  $T = 1$  year

$$I = (4,000 \times 8 \times 1)/100 \\ = ₹320$$

And,

$$A = ₹(4,000 + 320) \\ = ₹4,320$$

For 2<sup>nd</sup> year

$P = ₹4,320$ ;  $R = 8\%$  and  $T = 1$  year

$$I = (4,320 \times 8 \times 1)/100 \\ = ₹345.60$$

And,

$$A = ₹(4,320 + 345.60) \\ = ₹4,665.60$$

Hence,

$$\text{Compound interest} = ₹(4,665.60 - 4,000) \\ = ₹665.60$$

Now,

$$\text{Simple interest for 2 years} = (4000 \times 8 \times 2)/100 \\ = ₹640$$

Hence,

$$\text{Difference of CI and SI} = ₹(665.60 - 640) \\ = ₹25.60$$

2. A man lends ₹12,500 at 12% for the first year, at 15% for the second year and at 18% for the third year. If the rates of interest are compounded yearly ; find the difference between the C.I. for the first year and the compound interest for the third year.

**Solution:**

For 1<sup>st</sup> year

$P = ₹12,500$ ;  $R = 12\%$  and  $T = 1$  year

$$I = (12500 \times 12 \times 1)/100 \\ = ₹1,500$$

And,

$$A = ₹(12,500 + 1,500) \\ = ₹14,000$$

For 2<sup>nd</sup> year

$P = ₹14,000$ ;  $R = 15\%$  and  $T = 1$  year

$$I = (14000 \times 15 \times 1)/100 \\ = ₹2,100$$

And,

$$A = ₹(1,400 + 2,100) \\ = ₹16,100$$

For 3<sup>rd</sup> year

$$P = ₹16,100; R = 18\% \text{ and } T = 1 \text{ year}$$

$$I = (16100 \times 18 \times 1)/100 \\ = ₹2898$$

And,

$$A = ₹(16,100 + 2,898) \\ = ₹18,998$$

Hence,

The difference between the compound interest of the third year and first year

$$= ₹2,898 - ₹1,500$$

$$= ₹1,398$$

**3. A sum of money is lent at 8% per annum compound interest. If the interest for the second year exceeds that for the first year by ₹96, find the sum of money.**

**Solution:**

Let's assume the money lent to be ₹100

So,

For 1<sup>st</sup> year

$$P = ₹100; R = 8\% \text{ and } T = 1 \text{ year}$$

$$\text{Interest for the first year} = (100 \times 8 \times 1)/100 \\ = ₹8$$

$$\text{Amount} = ₹(100 + 8) \\ = ₹108$$

For 2<sup>nd</sup> year

$$P = ₹108; R = 8\% \text{ and } T = 1 \text{ year}$$

$$\text{Interest for the second year} = (108 \times 8 \times 1)/100 \\ = ₹8.64$$

Now,

$$\text{Difference between the interests for the second and first year} = ₹(8.64 - 8) = ₹0.64$$

But given that interest for the second year exceeds the first year by ₹96

Then,

When the difference between the interests is ₹0.64, principal is ₹100

So,

$$\text{When the difference between the interests is ₹96, principal} = ₹(96 \times 100/0.64) \\ = ₹15,000$$

Therefore, the sum of money lent is ₹15,000

**4. A man borrows ₹6,000 at 5% C.I. per annum. If he repays ₹1,200 at the end of each year, find the amount of the loan outstanding at the beginning of the third year.**

**Solution:**

Given, amount borrowed = ₹6,000 at  $R = 5\%$  C.I. per annum

So,

$$\begin{aligned}\text{Interest for the 1}^{\text{st}} \text{ year} &= (5/100 \times 6000) \\ &= ₹300\end{aligned}$$

And, the amount at the end of the first year will be

$$= ₹(6,000 + 300)$$

$$= ₹6,300$$

Given that an amount of ₹1,200 is repaid at the end of each year

Now,

The amount left to be paid at the end of 1<sup>st</sup> year

$$= ₹(6,300 - 1,200)$$

$$= ₹5,100$$

Then, the interest for the 2<sup>nd</sup> year is

$$= (5/100 \times 5100)$$

$$= ₹255$$

And, the amount will be = ₹(5100 + 255)

$$= ₹5,355$$

Now, the amount left to be paid at the end of 2<sup>nd</sup> year after reduction of ₹1,200 will be

$$= ₹(5,355 - 1,200)$$

$$= ₹4,155$$

Hence, the amount of the loan outstanding at the beginning of the third year is ₹4,155

**5. A man borrows ₹5,000 at 12 percent compound interest payable every six months. He repays ₹1,800 at the end of every six months. Calculate the third payment he has to make at the end of 18 months in order to clear the entire loan.**

**Solution:**

For 1<sup>st</sup> six months:

$P = ₹5,000$ ;  $R = 12\%$  and  $T = \frac{1}{2}$  year

$$\text{Interest} = (5000 \times 12 \times 1)/(2 \times 100)$$

$$= ₹300$$

And, Amount = ₹(5,000 + 300)

$$= ₹5,300$$

Given that the money repaid = ₹1,800

So, balance amount = ₹(5,300 - 1,800)

$$= ₹3,500$$

For 2<sup>nd</sup> six months:

$P = ₹3,500$ ;  $R = 12\%$  and  $T = \frac{1}{2}$  year

$$\text{Interest} = (3500 \times 12 \times 1)/(2 \times 100) \\ = ₹210$$

$$\text{And, Amount} = ₹(3,500 + 210) \\ = ₹3,710$$

$$\text{Again the money repaid} = ₹1,800$$

$$\text{So, balance amount} = ₹(3,710 - 1,800) \\ = ₹1,910$$

For 3<sup>rd</sup> six months:

$$P = ₹1,910; R = 12\% \text{ and } T = \frac{1}{2} \text{ year}$$

$$\text{Interest} = (1910 \times 12 \times 1)/(2 \times 100) \\ = ₹114.60$$

$$\text{And, Amount} = ₹(1,910 + 114.60) \\ = ₹2,024.60$$

Hence, the 3<sup>rd</sup> payment to be made to clear the entire loan is ₹2,024.60

**6. On a certain sum of money, the difference between the compound interest for a year, payable half-yearly, and the simple interest for a year is ₹180. Find the sum lent out, if the rate of interest in both the cases is 10% per annum.**

**Solution:**

Let assume a principal of ₹100

And, for  $R = 10\%$  and  $T = 1$  year

$$\text{S.I.} = (100 \times 10 \times 1)/100 \\ = ₹10$$

Compound interest payable half yearly

$R = 5\%$  half-yearly,  $T = \frac{1}{2} \text{ year} = 1$  half-year

Now, for first  $\frac{1}{2}$  year

$$I = (100 \times 5 \times 1)/100 \\ = ₹5$$

And,

$$A = ₹(100 + 5) \\ = ₹105$$

For second  $\frac{1}{2}$  year

$P = ₹105$  and  $R = 5\%$

$$I = (105 \times 5 \times 1)/100 \\ = ₹5.25$$

$$\text{Total compound interest} = ₹(5 + 5.25) \\ = ₹10.25$$

$$\text{Difference of C.I. and S.I.} = ₹(10.25 - 10) \\ = ₹0.25$$

So, when difference in interest is ₹10.25, the sum is ₹100

So, if the difference is ₹1, the sum is  $(100/0.25) = 400$

And,

If the difference is ₹180, the sum will be  $₹(400 \times 180) = ₹72,000$

Hence, the sum lent out is ₹72,000

**7. A manufacturer estimates that his machine depreciates by 15% of its value at the beginning of the year. Find the original value (cost) of the machine, if it depreciates by ₹5,355 during the second year.**

**Solution:**

Let's assume the original cost of the machine to be ₹100

Given that the machine depreciates by 15% during the first year

So, 15% of ₹100 = ₹15

Now,

The value of the machine at the beginning of the 2<sup>nd</sup> year will be

= ₹(100 – 15)

= ₹85

Again, the depreciation during the 2<sup>nd</sup> year = 15% of ₹85 = ₹12.75

Now,

When the depreciation during the 2<sup>nd</sup> year is ₹12.75, the original cost is ₹100

So,

When the depreciation during the 2<sup>nd</sup> year is ₹5,355, the original cost will be

=  $(100 \times 5355)/12.75$

= ₹42,000

Therefore, the original cost of the machine is ₹42,000

**8. A man invest ₹5,600 at 14% per annum compound interest for 2 years. Calculate:**

**(i) The interest for the first year.**

**(ii) The amount at the end of the first year.**

**(iii) The interest for the second year, correct to the nearest rupee.**

**Solution:**

(i) For the 1<sup>st</sup> year

$P = ₹5,600$ ;  $R = 14\%$  and  $T = 1$  year

$I = (5600 \times 14 \times 1)/100$

= ₹784

And,

(ii) Amount at the end of the first year is

= ₹(5600 + 784)

= ₹6,384

(iii) Now, for the 2<sup>nd</sup> year

$P = ₹6,384$ ;  $R = 14\%$  and  $R = 1$  year

$I = (6384 \times 14 \times 1)/100$

$$= ₹893.76 \sim ₹894 \text{ (nearly)}$$

Hence, the interest for the second year is ₹894

**9. A man saves ₹3,000 every year and invests it at the end of the year at 10% compound interest. Calculate the total amount of his savings at the end of the third year.**

**Solution:**

Savings at the end of every year = ₹3,000

So, for 2<sup>nd</sup> year

$P = ₹3,000$ ;  $R = 10\%$  and  $T = 1$  year

$$I = (3000 \times 10 \times 1)/100$$

$$= ₹300$$

And,

$$A = ₹(3000 + 300)$$

$$= ₹3,300$$

Now,

For 3<sup>rd</sup> year, savings = ₹3,000

So,  $P = ₹(3,000 + 3,300) = ₹6,300$

$R = 10\%$  and  $T = 1$  year

$$I = (6300 \times 10 \times 1)/100$$

$$= ₹630$$

And,

$$A = ₹(6,300 + 630) = ₹6,930$$

Amount at the end of 3<sup>rd</sup> year

$$= ₹(6,930 + 3,000)$$

$$= ₹9,930$$

Hence, the total amount of his savings at the end of the third year is ₹9,930

**10. A man borrows ₹10,000 at 5% per annum compound interest. He repays 35% of the sum borrowed at the end of the first year and 42% of the sum borrowed at the end of the second year. How much must he pay at the end of the third year in order to clear the debt?**

**Solution:**

Given,

The amount borrowed is ₹10,000 at  $R = 5\%$

Interest for the 1<sup>st</sup> year

$$I = (10000 \times 5)/100$$

$$= ₹500$$

And, the amount at the end of 1<sup>st</sup> year = ₹(10,000 + 500)

$$= ₹10,500$$

It's said that the man pays 35% of ₹10,500 at the end of the first year

$$= (35 \times 10500)/100$$

$$= ₹3,675$$

So, the amount left to be paid will be  
 $= ₹(10,500 - 3,675)$   
 $= ₹6,825$

Now,

The interest for the 2<sup>nd</sup> year is

$$I = (6,825 \times 5)/100$$
$$= ₹341.5$$

So, the amount at the end of the 2<sup>nd</sup> year will be

$$= ₹(6,825 + 341.25)$$
$$= ₹7,166.25$$

Given that the man pays 42% of ₹7,166.25 at the end of 2<sup>nd</sup> year

$$= (42 \times 7166.25)/100$$
$$= ₹3,009.825$$

$$\text{So, the amount left to be paid} = ₹(7,166.25 - 3,009.825)$$
$$= ₹4,156.425$$

Now, the interest for the third year

$$= (4156.425 \times 5)/100$$
$$= ₹207.82125$$

So, the amount at the end of the third year will be

$$= (4,156.425 + 207.82125)$$
$$= ₹4,364.24625$$

Hence, the man must pay an amount of ₹4,364.24625 at the end of 3<sup>rd</sup> year in order to clear the debt.

### Exercise 2(C)

1. A sum is invested at compound interest, compounded yearly. If the interest for two successive years is ₹5,700 and ₹7,410, calculate the rate of interest.

**Solution:**

We know that.

Rate of interest (%) = (Difference in the interest of the two consecutive periods  $\times$  100)/(C.I. of preceding year  $\times$  time)

$$\begin{aligned} &= [(7410 - 5700) \times 100]/(5700 \times 1) \\ &= 30\% \end{aligned}$$

Hence, the rate of interest is 30%

2. A certain sum of money is put at compound interest, compounded half-yearly. If the interest for two successive half-years are ₹650 and ₹760.50; find the rate of interest.

**Solution:**

The difference between the C.I. of two successive half-years is

$$= ₹(760.50 - 650)$$

$$= ₹110.50$$

So, ₹110.50 is the interest of one half-year on ₹650

Thus,

$$\begin{aligned} \text{Rate of interest} &= (100 \times I)/(P \times T) \% \\ &= (100 \times 110.50)/(650 \times \frac{1}{2}) \\ &= 34\% \end{aligned}$$

3. A certain sum amounts to ₹5,292 in two years and ₹5,556.60 in three years, interest being compounded annually. Find:

(i) the rate of interest.

(ii) the original sum.

**Solution:**

(i) Given,

Amount in two years = ₹5,292

Amount in three years = ₹5,556.60

So, the difference between the amounts of two successive years is

$$= ₹5,556.60 - ₹5,292$$

$$= ₹264.60$$

Hence, ₹264.60 is the interest for one year on ₹5,292

Thus,

$$\begin{aligned} \text{Rate of interest} &= (100 \times I)/(P \times T) \\ &= (100 \times 264.60)/(5292 \times 1) \\ &= 5\% \end{aligned}$$

(ii) Let's assume the sum of money to be ₹100

Then, the interest on it for the 1<sup>st</sup> year will be

$$= 5\% \text{ of ₹100}$$

= ₹5

So, the amount in one year = ₹(100 + 5) = ₹105

Similarly,

The amount in two years = ₹105 + 5% of ₹105

$$= ₹(105 + 5.25)$$

$$= ₹110.25$$

When amount in two years is ₹110.25, sum = ₹100

Hence,

When amount in two years is ₹5,292, sum = ₹(100 × 5292)/110.25

$$= ₹4,800$$

**4. The compound interest, calculated yearly, on a certain sum of money for the second year is ₹1,089 and for the third year it is ₹1,197.90. Calculate the rate of interest and the sum of money.**

**Solution:**

(i) C.I. for second year = ₹1,089

C.I. for third year = ₹1,197.90

Thus, the difference between the C.I. of two successive years

$$= ₹(1,197.90 - 1,089)$$

$$= ₹108.90$$

Hence, ₹108.90 is the interest of one year on ₹1,089

Thus,

$$\text{Rate of interest} = (100 \times I)/(P \times T)$$

$$= (100 \times 108.90)/(1089 \times 1)$$

$$= 10\%$$

(ii) Let's assume the sum of money to be ₹100

So, interest on it for in the 1<sup>st</sup> year = 10% of ₹100

$$= ₹10$$

And, the amount after one year = ₹(100 + 10)

$$= ₹110$$

Similarly, C.I. for the 2<sup>nd</sup> year = 10% of ₹110

$$= ₹11$$

When C.I. for 2<sup>nd</sup> year is ₹11, the sum is ₹100

Hence,

When C.I. for 2<sup>nd</sup> year is ₹1,089, the sum is ₹(100 × 1089)/11 = ₹9,900

**5. Mohit invests ₹8,000 for 3 years at a certain rate of interest, compounded annually. At the end of one year it amounts to ₹9,440. Calculate:**

**(i) the rate of interest per annum.**

**(ii) the amount at the end of the second year.**

**(iii) the interest accrued in the third year.**

**Solution:**

For the 1<sup>st</sup> year

$$P = ₹8,000; A = ₹9,440 \text{ and } T = 1 \text{ year}$$
$$\text{Interest} = ₹(9,440 - 8,000)$$
$$= ₹1,440$$

So,

$$\text{Rate} = (I \times 100)/(P \times T)$$
$$= (1,440 \times 100)/(8,000 \times 1)$$
$$= 18\%$$

(i) Hence, the rate of interest per annum is 18%

For the 2<sup>nd</sup> year

$$P = ₹9,440; R = 18\% \text{ and } T = 1 \text{ year}$$
$$\text{Interest} = (9440 \times 18 \times 1)/100$$
$$= ₹1,699.20$$

And,

$$\text{Amount} = ₹(9,440 + 1,699.20) = ₹11,139.20$$

(ii) Hence, the amount at the end of second year is ₹11,139.20

For the 3<sup>rd</sup> year

$$P = ₹11,139.20; R = 18\% \text{ and } T = 1 \text{ year}$$
$$\text{Interest} = (11139.20 \times 18 \times 1)/100$$
$$= ₹2,005.06$$

(iii) Hence, the interest accrued in the third year is ₹2,005.06

**6. Geeta borrowed ₹15,000 for 18 months at a certain rate of interest compounded semi-annually. If at the end of six months it amounted to ₹15,600; Calculate :**

**(i) the rate of interest per annum.**

**(ii) the total amount of money that Geeta must pay at the end of 18 months in order to clear the account.**

**Solution:**

For 1<sup>st</sup> half-year

$$P = ₹15,000; A = ₹15,600 \text{ and } T = \frac{1}{2} \text{ year}$$

Now,

$$\text{Interest} = ₹(15,600 - 15,000)$$
$$= ₹600$$

(i) Hence,

$$\text{Rate} = (I \times 100)/(P \times T)\%$$
$$= 8\%$$

For 2<sup>nd</sup> half-year

$$P = ₹15,600; R = 8\% \text{ and } T = \frac{1}{2} \text{ year}$$

$$\text{Interest} = (15,000 \times 8 \times \frac{1}{2})/100$$
$$= ₹624$$

So,

$$\text{Amount} = ₹(15,600 + 624)$$
$$= ₹16,224$$

For 3<sup>rd</sup> half-year

$P = ₹16,224$ ;  $R = 8\%$  and  $T = \frac{1}{2}$  year

$$\begin{aligned}\text{Interest} &= (16,224 \times 8 \times \frac{1}{2})/100 \\ &= ₹648.96\end{aligned}$$

So,

$$\begin{aligned}\text{Amount} &= ₹(16,224 + 648.96) \\ &= ₹16,872.96\end{aligned}$$

Therefore, the total amount of money that Geeta must pay at the end of 18 months in order to clear the account is ₹16,872.96

**7. Ramesh invests ₹12,800 for three years at the rate of 10% per annum compound interest. Find:**

**(i) the sum due to Ramesh at the end of the first year.**

**(ii) the interest he earns for the second year.**

**(iii) the total amount due to him at the end of the third year.**

**Solution:**

For 1<sup>st</sup> year

$P = ₹12,800$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= (12,800 \times 10 \times 1)/100 \\ &= ₹1,280\end{aligned}$$

And,

$$\begin{aligned}\text{Amount} &= ₹(12,800 + 1,280) \\ &= ₹14,080\end{aligned}$$

(i) Hence, the sum due to Ramesh at the end of the first year is ₹14,080

For 2<sup>nd</sup> year

$P = ₹14,080$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= (14,080 \times 10 \times 1)/100 \\ &= ₹1,408\end{aligned}$$

(ii) Hence, the interest earned for the second year is ₹1,408

And,

$$\begin{aligned}\text{Amount} &= ₹(14,080 + 1,408) \\ &= ₹15,488\end{aligned}$$

For 3<sup>rd</sup> year

$P = ₹15,488$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(15,488 \times 10 \times 1)/100 \\ &= ₹1,548.80\end{aligned}$$

And,

$$\begin{aligned}\text{Amount} &= ₹(15,488 + 1,548.80) \\ &= ₹17,036.80\end{aligned}$$

(iii) Hence, the total amount due to Ramesh at the end of third year is ₹17,036.80

8. ₹8,000 is lent out at 7% compound interest for 2 years. At the end of the first year ₹3,560 are returned. Calculate:

(i) the interest paid for the second year.

(ii) the total interest paid in two years.

(iii) the total amount of money paid in two years to clear the debt.

**Solution:**

(i) For 1<sup>st</sup> year

$P = ₹8,000$ ;  $R = 7\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= (8,000 \times 7 \times 1)/100 \\ &= ₹560\end{aligned}$$

$$\begin{aligned}\text{Amount} &= ₹(8,000 + 560) \\ &= ₹8,560\end{aligned}$$

Now, the money returned = ₹3,560

So,

$$\begin{aligned}\text{Balance money for 2<sup>nd</sup> year} &= ₹(8,560 - 3,560) \\ &= ₹5,000\end{aligned}$$

For 2<sup>nd</sup> year

$P = ₹5,000$ ;  $R = 7\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest paid for the second year} &= (5000 \times 7 \times 1)/100 \\ &= ₹350\end{aligned}$$

$$\begin{aligned}\text{(ii) The total interest paid in two years} &= ₹(350 + 560) \\ &= ₹910\end{aligned}$$

$$\begin{aligned}\text{(iii) The total amount of money paid in two years to clear the debt} \\ &= ₹(8,000 + 910) \\ &= ₹8,910\end{aligned}$$

9. The cost of a machine depreciated by ₹4,000 during the first year and by ₹3,600 during the second year. Calculate:

(i) The rate of depreciation

(ii) The original cost of the machine

(iii) It's cost at the end of the third year

**Solution:**

(i) Difference between depreciation in value between the first and second years is

$$₹(4,000 - 3,600) = ₹400$$

So, the depreciation of one year on ₹4,000 = ₹400

$$\begin{aligned}\text{Hence, the rate of depreciation} &= (40/4000) \times 100\% \\ &= 10\%\end{aligned}$$

(ii) Let's assume ₹100 to be the original cost of the machine

$$\begin{aligned}\text{Depreciation during the 1<sup>st</sup> year} &= 10\% \text{ of } ₹100 \\ &= ₹10\end{aligned}$$

So,

When the values depreciates by Rs.10 during the 1<sup>st</sup> year, then the original cost is ₹100

Then, when the depreciation during 1<sup>st</sup> year is ₹4,000, the original cost is

$$(100/10) \times 4,000 = ₹40,000$$

Hence, the original cost of the machine is ₹40,000.

(iii) Total depreciation during all the three years

= Depreciation in value during (1<sup>st</sup> year + 2<sup>nd</sup> year + 3<sup>rd</sup> year)

$$= ₹4,000 + ₹3,600 + 10\% \text{ of } (₹40,000 - ₹7,600)$$

$$= ₹4,000 + ₹3,600 + ₹3,240$$

$$= ₹10,840$$

Thus,

$$\text{The cost of the machine at the end of the third year} = ₹40,000 - ₹10,840$$

$$= ₹29,160$$

**10. Find the sum, invested at 10% compounded annually, on which the interest for the third year exceeds the interest of the first year by ₹252.**

**Solution:**

Let's assume the sum of money be ₹100

And, the rate of interest = 10% p.a.

Interest at the end of 1<sup>st</sup> year = 10% of ₹100

$$= ₹10$$

Amount at the end of 1<sup>st</sup> year = ₹(100 + 10)

$$= ₹110$$

Interest at the end of 2<sup>nd</sup> year = 10% of ₹110

$$= ₹11$$

Amount at the end of 2<sup>nd</sup> year = ₹(110 + 11)

$$= ₹121$$

Interest at the end of 3<sup>rd</sup> year = 10% of ₹121

$$= ₹12.10$$

Hence, the difference between interest of 3<sup>rd</sup> year and 1<sup>st</sup> year

$$= ₹(12.10 - 10)$$

$$= ₹2.10$$

Now,

When difference is ₹2.10, the principal is ₹100

When difference is ₹252, the principal =  $(100 \times 252) / (2 \times 10)$

$$= ₹12,000$$

Hence, the sum invested is ₹12,000

**11. A man borrows ₹10,000 at 10% compound interest compounded yearly. At the end of each year, he pays back 30% of the sum borrowed. How much money is left unpaid just after the second year?**

**Solution:**

For 1<sup>st</sup> year

$P = ₹10,000$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= (10,000 \times 10 \times 1)/100 \\ &= ₹1,000\end{aligned}$$

$$\begin{aligned}\text{Amount at the end of 1}^{\text{st}} \text{ year} &= ₹(10,000 + 1,000) \\ &= ₹11,000\end{aligned}$$

$$\begin{aligned}\text{Money paid at the end of 1}^{\text{st}} \text{ year} &= 30\% \text{ of } ₹10,000 \\ &= ₹3,000\end{aligned}$$

Hence,

$$\begin{aligned}\text{Principal for 2}^{\text{nd}} \text{ year} &= ₹(11,000 - 3,000) \\ &= ₹8,000\end{aligned}$$

For 2<sup>nd</sup> year

$P = ₹8,000$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= (8,000 \times 10 \times 1)/100 \\ &= ₹800\end{aligned}$$

And,

$$\begin{aligned}\text{Amount at the end of 2}^{\text{nd}} \text{ year} &= ₹8,000 + ₹800 \\ &= ₹8,800\end{aligned}$$

So,

$$\begin{aligned}\text{Money paid at the end of 2}^{\text{nd}} \text{ year} &= 30\% \text{ of } ₹10,000 \\ &= ₹3,000\end{aligned}$$

Hence,

$$\begin{aligned}\text{The principal for 3}^{\text{rd}} \text{ year} &= ₹8,800 - ₹3,000 \\ &= ₹5,800\end{aligned}$$

**12. A man borrows ₹10,000 at 10% compound interest compounded yearly. At the end of each year, he pays back 20% of the amount for that year. How much money is left unpaid just after the second year?**

**Solution:**

For 1<sup>st</sup> year

$P = ₹10,000$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(10,000 \times 10 \times 1)/100 \\ &= ₹1,000\end{aligned}$$

So,

$$\begin{aligned}\text{Amount at the end of 1}^{\text{st}} \text{ year} &= ₹(10,000 + 1,000) \\ &= ₹11,000\end{aligned}$$

And,

$$\begin{aligned}\text{Money paid at the end of 1}^{\text{st}} \text{ year} &= 20\% \text{ of } ₹11,000 \\ &= ₹2,200\end{aligned}$$

Hence,

$$\text{Principal for 2}^{\text{nd}} \text{ year} = ₹11,000 - ₹2,200 = ₹8,800$$

For 2<sup>nd</sup> year

$P = ₹8,800$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(8,800 \times 10 \times 1)/100 \\ &= ₹880\end{aligned}$$

So,

$$\begin{aligned}\text{Amount at the end of 2}^{\text{nd}} \text{ year} &= ₹8,800 + ₹880 \\ &= ₹9,680\end{aligned}$$

And,

$$\begin{aligned}\text{Money paid at the end of 2}^{\text{nd}} \text{ year} &= 20\% \text{ of } ₹9,680 \\ &= ₹1,936\end{aligned}$$

Hence,

$$\begin{aligned}\text{Principal for 3}^{\text{rd}} \text{ year} &= ₹9,680 - ₹1,936 \\ &= ₹7,744\end{aligned}$$

### Exercise 2(D)

1. What sum will amount of ₹6,593.40 in 2 years at C.I., if the rates are 10 per cent and 11 per cent for the two successive years?

**Solution:**

Let's assume the principal (P) to be ₹100

For 1<sup>st</sup> year, we have

P = ₹100; R = 10% and T = 1 year

So,

$$I = (100 \times 10 \times 1)/100 \\ = ₹10$$

And,

$$A = ₹(100 + 10) = ₹110$$

For 2<sup>nd</sup> year, we have

P = ₹110; R = 11% and T = 1 year

So,

$$I = (110 \times 11 \times 1)/100 \\ = ₹12.10$$

And,

$$A = ₹(110 + 12.10) \\ = ₹122.10$$

Now,

If the amount is ₹122.10 for a sum of ₹100

Then,

If amount is ₹1, sum will be ₹(100/122.10)

And,

If amount is ₹6,593.40, sum will be ₹(100/122.10) × 6,593.40 = ₹5,400

Therefore, the sum is ₹5,400

2. The value of a machine depreciated by 10% per year during the first two years and 15% per year during the third year. Express the total depreciation of the machine, as per cent, during the three years.

**Solution:**

Let's assume the value of machine in the beginning to be ₹100

For 1<sup>st</sup> year,

$$\text{Depreciation} = 10\% \text{ of } ₹100 \\ = ₹10$$

So, the value of machine for second year will become ₹(100 – 10) = ₹90

For 2<sup>nd</sup> year,

$$\text{Depreciation} = 10\% \text{ of } ₹90 = ₹9$$

So, the value of machine for third year will become ₹(90 – 9) = ₹81

For 3<sup>rd</sup> year,

Depreciation = 15% of ₹81 = ₹12.15

So, the value of machine at the end of third year = ₹(81 - 12.15) = ₹68.85

Thus,

Net depreciation = ₹(100 - 68.85) = ₹31.15

Or 31.15%

**3. Rachna borrows ₹12,000 at 10 percent per annum interest compounded half-yearly. She repays ₹4,000 at the end of every six months. Calculate the third payment she has to make at end of 18 months in order to clear the entire loan.**

**Solution:**

For 1<sup>st</sup> half-year

P = ₹12,000; R = 10% and T =  $\frac{1}{2}$  year

Interest = ₹(12,000 × 10 × 1)/(100 × 2)  
= ₹600

And,

Amount = ₹12,000 + ₹600  
= ₹12,600

Money paid at the end of 1<sup>st</sup> half year = ₹4,000

So, the balance money for 2<sup>nd</sup> half-year = ₹12,600 - ₹4,000  
= ₹8,600

For 2<sup>nd</sup> half-year

P = ₹8,600; R = 10% and T =  $\frac{1}{2}$  year

Interest = ₹(8,600 × 10 × 1)/(100 × 2)  
= ₹430

And,

Amount = ₹8,600 + ₹430  
= ₹9,030

Money paid at the end of 2<sup>nd</sup> half-year = ₹4,000

So, the balance money for 3<sup>rd</sup> half-year = ₹9,030 - ₹4,000  
= ₹5,030

For 3<sup>rd</sup> half-year

P = ₹5,030; R = 10% and T =  $\frac{1}{2}$  year

Interest = ₹(5,030 × 10 × 1)/(100 × 2)  
= ₹251.50

And,

Amount = ₹(5,030 + 251.50)  
= ₹5,281.50

Hence, Rachna has to pay an amount of ₹5,281.50 as third payment in order to clear the entire loan

**4. On a certain sum of money, invested at the rate of 10 percent per annum**

compounded annually, the interest for the first year plus the interest for the third year is ₹2,652. Find the sum.

**Solution:**

Let's assume the principal as ₹100

For 1<sup>st</sup> year

P = ₹100; R = 10% and T = 1 year

$$\begin{aligned}\text{Interest} &= ₹(100 \times 10 \times 1)/100 \\ &= ₹10\end{aligned}$$

And,

$$\begin{aligned}\text{Amount} &= ₹(100 + 10) \\ &= ₹110\end{aligned}$$

For 2<sup>nd</sup> year

P = ₹110; R = 10% and T = 1 year

$$\begin{aligned}\text{Interest} &= ₹(110 \times 10 \times 1)/100 \\ &= ₹11\end{aligned}$$

And,

$$\begin{aligned}\text{Amount} &= ₹(110 + 11) \\ &= ₹121\end{aligned}$$

For 3<sup>rd</sup> year

P = ₹121; R = 10% and T = 1 year

$$\begin{aligned}\text{Interest} &= ₹(121 \times 10 \times 1)/100 \\ &= ₹12.10\end{aligned}$$

$$\begin{aligned}\text{Sum of C.I. for 1<sup>st</sup> year and 3<sup>rd</sup> year} &= ₹(10 + 12.10) \\ &= ₹22.10\end{aligned}$$

Now,

When sum is ₹22.10, principal is ₹100

So,

When sum is ₹2,652, principal will be  $(100 \times 2652)/22.10 = ₹12,000$

Hence, the sum is ₹12,000

**5. During every financial year, the value of a machine depreciates by 12%. Find the original cost of a machine which depreciates by ₹2,640 during the second financial year of its purchase.**

**Solution:**

Let's assume the original value of the machine to be ₹100

For 1<sup>st</sup> year

P = ₹100; R = 12% and T = 1 year

$$\begin{aligned}\text{Depreciation in 1<sup>st</sup> year} &= ₹(100 \times 12 \times 1)/100 \\ &= ₹12\end{aligned}$$

$$\begin{aligned}\text{Value at the end of 1<sup>st</sup> year} &= ₹(100 - 12) \\ &= ₹88\end{aligned}$$

For 2<sup>nd</sup> year

P = ₹88; R = 12% and T = 1 year

$$\begin{aligned}\text{Depreciation in 2}^{\text{nd}} \text{ year} &= ₹(88 \times 12 \times 1)/100 \\ &= ₹10.56\end{aligned}$$

Now,

When depreciation in 2<sup>nd</sup> year is ₹10.56, original cost is ₹100

So,

$$\begin{aligned}\text{When depreciation in 2}^{\text{nd}} \text{ year is ₹2,640, original cost will be } &(100 \times 2,640)/10.56 \\ &= ₹25,000\end{aligned}$$

Hence, the original cost of the machine is ₹25,000

**6. Find the sum on which the difference between the simple interest and compound interest at the rate of 8% per annum compounded annually would be ₹64 in 2 years.**

**Solution:**

Let's assume ₹x to be the sum.

So, the S.I. is

$$\begin{aligned}&= (x \times 8 \times 2)/100 \\ &= 0.16x\end{aligned}$$

Now,

Compound interest

For 1<sup>st</sup> year:

$$P = ₹x, R = 8\% \text{ and } T = 1$$

$$\begin{aligned}\text{Interest} &= (x \times 8 \times 1)/100 \\ &= 0.08x\end{aligned}$$

$$\begin{aligned}\text{And, amount} &= ₹(x + 0.08x) \\ &= ₹1.08x\end{aligned}$$

For 2<sup>nd</sup> year:

$$P = ₹1.08x, R = 8\% \text{ and } T = 1$$

$$\begin{aligned}\text{Interest} &= (1.08x \times 8 \times 1)/100 \\ &= 0.0864x\end{aligned}$$

$$\begin{aligned}\text{And, amount} &= ₹(1.08x + 0.0864x) \\ &= ₹1.1664x\end{aligned}$$

So,

$$\begin{aligned}\text{C.I.} &= \text{Amount} - P \\ &= ₹(1.1664x - x) \\ &= ₹0.1664x\end{aligned}$$

Given that,

The difference between the simple interest and compound interest at the rate of 8% per annum compounded annually should be ₹64 in 2 years.

$$₹0.1664x - ₹0.16x = ₹64$$

$$₹0.0064x = ₹64$$

$$x = ₹10000$$

Therefore, the sum is ₹10,000.

**7. A sum of ₹13,500 is invested at 16% per annum compound interest for 5 years.**

**Calculate:**

**(i) the interest for the first year.**

**(ii) the amount at the end of first year.**

**(iii) the interest for the second year, correct to the nearest rupee.**

**Solution:**

For 1<sup>st</sup> year

$P = ₹13,500$ ;  $R = 16\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(13,500 \times 16 \times 1)/100 \\ &= ₹2,160\end{aligned}$$

(i) The interest for the first year is ₹2,160

And,

$$\begin{aligned}\text{Amount} &= ₹13,500 + ₹2,160 \\ &= ₹15,660\end{aligned}$$

(ii) The amount at the end of first year is ₹15,660

For 2<sup>nd</sup> year

$P = ₹15,660$ ;  $R = 16\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(15,660 \times 16 \times 1)/100 \\ &= ₹2,505.60 \\ &= ₹2,506 \text{ (corrected to the nearest rupee)}\end{aligned}$$

(iii) Hence, the interest for the second year is ₹2,506

**8. Saurabh invests ₹48,000 for 7 years at 10% per annum compound interest.**

**Calculate:**

**(i) the interest for the first year.**

**(ii) the amount at the end of second year.**

**(iii) the interest for the third year.**

**Solution:**

For 1<sup>st</sup> year

$P = ₹48,000$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(48,000 \times 10 \times 1)/100 \\ &= ₹4,800\end{aligned}$$

(i) Hence, the interest for the first year is ₹4,800

And,

$$\begin{aligned}\text{Amount} &= ₹48,000 + ₹4,800 \\ &= ₹52,800\end{aligned}$$

For 2<sup>nd</sup> year

$P = ₹52,800$ ;  $R = 10\%$  and  $T = 1$  year

$$\begin{aligned}\text{Interest} &= ₹(52,800 \times 10 \times 1)/100 \\ &= ₹5,280\end{aligned}$$

And,

$$\text{Amount} = ₹52,800 + ₹5,280 = ₹58,080$$

(ii) Hence, the amount at the end of second year is ₹58,080

For 3<sup>rd</sup> year

$P = ₹58,080$ ;  $R = 10\%$  and  $T = 1\text{ year}$

$$\begin{aligned}\text{Interest} &= ₹(58,080 \times 10 \times 1)/100 \\ &= ₹5,808\end{aligned}$$

(iii) Hence, the interest for the third year is ₹5,808

**9. Ashok borrowed ₹12,000 at some rate on compound interest. After a year, he paid back ₹4,000. If the compound interest for the second year is ₹920, find:**

**i. The rate of interest charged**

**ii. The amount of debt at the end of the second year**

**Solution:**

(i) Let's assume  $x\%$  to be the rate of interest charged

Then C.I., calculated

For 1<sup>st</sup> year

$P = ₹12,000$ ,  $R = x\%$  and  $T = 1\text{ year}$

$$\begin{aligned}\text{Interest} &= (12,000 \times x \times 1)/100 \\ &= 120x\end{aligned}$$

And, amount = ₹(12,000 + 120x)

For 2<sup>nd</sup> year

After a year, given that Ashok paid back ₹4,000.

$$P = (₹12,000 + ₹120x) - ₹4,000 = ₹(8,000 + 120x)$$

$$\begin{aligned}\text{Interest} &= [(8,000 + 120x) \times x \times 1]/100 \\ &= ₹(80x + 1.20x^2)\end{aligned}$$

But given,

The compound interest for the second year is ₹920

$$₹(80x + 1.20x^2) = ₹920$$

$$1.20x^2 + 80x - 920 = 0$$

$$3x^2 + 200x - 2300 = 0$$

$$3x^2 + 230x - 30x - 2300 = 0$$

$$x(3x + 230) - 10(3x + 230) = 0$$

$$(3x + 230)(x - 10) = 0$$

$$x = -230/3 \text{ or } x = 10$$

Since, the rate of interest cannot be negative

So,  $x = 10$

Therefore, the rate of interest charged is 10%.

(ii) For 1<sup>st</sup> year:

$$\text{Interest} = ₹120x = ₹1200$$

For 2<sup>nd</sup> year:

$$\text{Interest} = ₹(80x + 1.20x^2) = ₹920$$

The amount of debt at the end of the second year is equal to the sum of the principal of the second year and interest for the two years.

Thus,

$$\text{Total debt} = ₹(8,000 + 1,200 + 920) = ₹10,120$$

**10. On a certain sum of money, lent out at C.I., interests for first, second and third years are ₹1,500, ₹1,725 and ₹2,070 respectively. Find the rate of interest for the (i) second year (ii) third year.**

**Solution:**

Given,

The interest obtained in the first year is ₹1,500

The interest obtained in the second year is ₹1,750

Now,

(i) Difference between the interests of second year and first year is

$$= ₹1,725 - ₹1,500$$

$$= ₹225$$

So,

The rate of interest for the second year is calculated as

$$= (225/1,500) \times 100$$

$$= 15\%$$

Now,

(ii) Difference between the interests of third year and second year is

$$= ₹2,070 - ₹1,725$$

$$= ₹345$$

So,

The rate of interest for the second year is calculated as

$$= (345/1,725) \times 100$$

$$= 20\%$$

Therefore, the rates of interest for the second and third year are 15% and 20% respectively.
