

Exercise 16(A)

1. In the given figure, if area of triangle ADE is 60 cm^2 , state, given reason, the area of:
 (i) Parallelogram ABED
 (ii) Rectangle ABCF
 (iii) Triangle ABE

Solution:

(i) As $\triangle ADE$ and parallelogram ABED are on the same base AB and between the same parallels $DE \parallel AB$, the area of the $\triangle ADE$ will be half the area of parallelogram ABED.

So,

$$\begin{aligned} \text{Area of parallelogram ABED} &= 2 \times \text{Area of } \triangle ADE \\ &= 2 \times 60 \text{ cm}^2 \\ &= 120 \text{ cm}^2 \end{aligned}$$

(ii) Area of parallelogram is equal to the area of rectangle on the same base and of the same altitude i.e., between the same parallels

So,

$$\text{Area of rectangle ABCF} = \text{Area of parallelogram ABED} = 120 \text{ cm}^2$$

(iii) We know that, area of triangles on the same base and between same parallel lines are equal

So,

$$\text{Area of } \triangle ABE = \text{Area of } \triangle ADE = 60 \text{ cm}^2$$

2. The given figure shows a rectangle ABDC and a parallelogram ABEF; drawn on opposite sides of AB. Prove that:

(i) Quadrilateral CDEF is a parallelogram.

(ii) Area of quad. CDEF = Area of rect. ABDC + Area of || gm. ABEF.

Solution:

After drawing the opposite sides of AB, we get

It's seen from the figure that $CD \parallel FE$. Therefore, FC must be parallel to DE . Thus, it is proved that the quadrilateral $CDEF$ is a parallelogram.

We know that,

Area of parallelograms on same base and between same parallel lines is always equal. Also, area of parallelogram is equal to the area of rectangle on the same base and of the same altitude i.e., between same parallel lines.

So,

$$\text{Area of } CDEF = \text{Area of } ABDC + \text{Area of } ABEF$$

- Hence Proved.

3. In the given figure, diagonals PR and QS of the parallelogram PQRS intersect at point O and LM is parallel to PS. Show that:

- (i) $2 \text{ Area } (\triangle POS) = \text{Area (||gm PMLS)}$
 (ii) $\text{Area } (\triangle POS) + \text{Area } (\triangle QOR) = \frac{1}{2} \text{Area (||gm PQRS)}$
 (iii) $\text{Area } (\triangle POS) + \text{Area } (\triangle QOR) = \text{Area } (\triangle POQ) + \text{Area } (\triangle SOR)$.

Solution:

(i) As $\triangle POS$ and parallelogram $PMLS$ are on the same base PS and between the same parallels i.e., $SP \parallel LM$

Since O is the center of LM and ratio of areas of triangles with same vertex and bases along the same line is equal to ratio of their respective bases

Also, the area of the parallelogram is twice the area of the triangle if they lie on the same base and in between the same parallels

Thus, $2 \text{ Area } (\triangle PSO) = \text{Area}(PMLS)$

(ii) Taking LHS, we have

LM is parallel to PS and PS is parallel to RQ , therefore, LM is parallel to RQ

And, since $\triangle POS$ lie on the base PS and in between the parallels PS and LM , we have

$$\text{Area } (\triangle POS) = \frac{1}{2} \text{Area } (PSLM)$$

Also, since $\triangle QOR$ lie on the base QR and in between the parallels LM and RQ , we have

$$\text{Area } (\triangle QOR) = \frac{1}{2} \text{Area } (LMQR)$$

Now,

$$\begin{aligned} \text{Area}(\triangle POS) + \text{Area}(\triangle QOR) &= \frac{1}{2} \text{Area}(PSLM) + \frac{1}{2} \text{Area}(LMQR) \\ &= \frac{1}{2} [\text{Area}(PSLM) + \text{Area}(LMQR)] \\ &= \frac{1}{2} \text{Area}(PQRS) \end{aligned}$$

(iii) We know that, the diagonals in a parallelogram bisect each other.

So, $OS = OQ$

In $\triangle PQS$, as $OS = OQ$

OP is the median of the $\triangle PQS$.

We know that median of a triangle divides it into two triangles of equal area.

Therefore,

$$\text{Area } (\triangle POS) = \text{Area } (\triangle POQ) \dots (1)$$

Similarly, as OR is the median of the triangle QRS , we have

$$\text{Area } (\triangle QOR) = \text{Area } (\triangle SOR) \dots (2)$$

Now, adding (1) and (2) we get

$$\text{Area } (\triangle POS) + \text{area } (\triangle QOR) = \text{Area } (\triangle POQ) + \text{Area } (\triangle SOR)$$

- Hence Proved.

4. In parallelogram ABCD, P is a point on side AB and Q is a point on side BC.

Prove that:

(i) $\triangle CPD$ and $\triangle AQD$ are equal in area.

(ii) $\text{Area } (\triangle AQD) = \text{Area } (\triangle APD) + \text{Area } (\triangle CPB)$

Solution:

Given, ABCD is a parallelogram.

P and Q are any points on the sides AB and BC respectively.

Join diagonals AC and BD.

Proof:

(i) As triangles with same base and between same set of parallel lines have equal areas

$$\text{Area } (\triangle CPD) = \text{Area } (\triangle BCD) \dots\dots (1)$$

Again, diagonals of the parallelogram bisect area in two equal parts

$$\text{Area } (\triangle BCD) = \frac{1}{2} \text{ area of parallelogram ABCD} \dots\dots (2)$$

From (1) and (2)

$$\text{Area } (\triangle CPD) = \frac{1}{2} \text{ Area } (ABCD) \dots\dots (3)$$

Similarly,

$$\text{Area } (\triangle AQD) = \text{Area } (\triangle ABD) = \frac{1}{2} \text{ Area } (ABCD) \dots\dots (4)$$

From (3) and (4), we get

$$\text{Area } (\triangle CPD) = \text{Area } (\triangle AQD)$$

- Hence proved.

(ii) We know that, area of triangles on the same base and between same parallel lines are equal

So,

Area of $\triangle AQD = \text{Area of } \triangle ACD = \text{Area of } \triangle PDC = \text{Area of } \triangle BDC = \text{Area of } \triangle ABC = \text{Area of } \triangle APD + \text{Area of } \triangle BPC$
- Hence Proved

5. In the given figure, M and N are the mid-points of the sides DC and AB respectively of the parallelogram ABCD.

If the area of parallelogram ABCD is 48 cm^2

(i) State the area of the triangle BEC.

(ii) Name the parallelogram which is equal in area to the triangle BEC.

Solution:

(i) As $\triangle BEC$ and parallelogram ABCD are on the same base BC and between the same parallels i.e., $BC \parallel AD$.

$$\text{Area } (\triangle BEC) = \frac{1}{2} \times \text{Area } (ABCD) = \frac{1}{2} \times 48 = 24 \text{ cm}^2$$

$$\begin{aligned} \text{(ii) Area } (ANMD) &= \text{Area } (BNMC) \\ &= \frac{1}{2} \times \text{Area } (ABCD) \\ &= \frac{1}{2} \times 2 \times \text{Area } (\triangle BEC) \\ &= \text{Area } (\triangle BEC) \end{aligned}$$

Therefore, the parallelograms ANMD and NBCM have areas equal to $\triangle BEC$.

6. In the following figure, CE is drawn parallel to diagonals DB of the quadrilateral ABCD which meets AB produced at point E.

Prove that $\triangle ADE$ and quadrilateral ABCD are equal in area.

Solution:

As, $\triangle DCB$ and $\triangle DEB$ are on the same base DB and between the same parallels i.e., $DB \parallel CE$,
We have,

$$\text{Area } (\triangle DCB) = \text{Area } (\triangle DEB)$$

$$\text{Area } (\triangle DCB + \triangle ADB) = \text{Area } (\triangle DEB + \triangle ADB)$$

$$\text{Area } (ABCD) = \text{Area } (\triangle ADE)$$

- Hence proved

7. ABCD is a parallelogram a line through A cuts DC at point P and BC produced at Q. Prove that triangle BCP is equal in area to triangle DPQ.

Solution:

Its seen that, $\triangle APB$ and parallelogram $ABCD$ are on the same base AB and between the same parallel lines AB and CD .

So,

$$\text{Ar}(\triangle APB) = \frac{1}{2} \text{Ar}(\text{||gm } ABCD) \dots (i)$$

Now,

$\triangle ADQ$ and parallelogram $ABCD$ are on the same base AD and between the same parallel lines

AD and BQ.

So,

$$\text{Ar}(\triangle ADQ) = \frac{1}{2} \text{Ar}(\text{||gm ABCD}) \dots \text{(ii)}$$

On adding equation (i) and (ii), we get

$$\text{Ar}(\triangle APB) + \text{Ar}(\triangle ADQ) = \frac{1}{2} \text{Ar}(\text{||gm ABCD}) + \frac{1}{2} \text{Ar}(\text{||gm ABCD}) = \text{Ar}(\text{||gm ABCD})$$

$$\text{Ar}(\text{quad. ADQB}) - \text{Ar}(\triangle BPQ) = \text{Ar}(\text{||gm ABCD})$$

$$\text{Ar}(\text{quad. ADQB}) - \text{Ar}(\triangle BPQ) = \text{Ar}(\text{quad. ADQB}) - \text{Ar}(\triangle DCQ)$$

$$\text{Ar}(\triangle BPQ) = \text{Ar}(\triangle DCQ)$$

Subtracting $\text{Ar}(\triangle PCQ)$ from both the sides, we get

$$\text{Ar}(\triangle BPQ) - \text{Ar}(\triangle PCQ) = \text{Ar}(\triangle DCQ) - \text{Ar}(\triangle PCQ)$$

$$\text{Ar}(\triangle BCP) = \text{Ar}(\triangle DPQ)$$

- Hence proved.

8. The given figure shows a pentagon ABCDE. EG drawn parallel to DA meets BA produced at G and CF drawn parallel to DB meets AB produced at F. Prove that the area of pentagon ABCDE is equal to the area of triangle GDF.

Solution:

It's seen that triangles EDG and EGA are on the same base EG and between the same parallel lines EG and DA, so

$$\text{Ar}(\triangle EDG) = \text{Ar}(\triangle EGA)$$

On subtracting $\triangle EOG$ from both sides, we have
 $Ar(\triangle EDG) - Ar(\triangle EOG) = Ar(\triangle EGA) - Ar(\triangle EOG)$
 $Ar(\triangle EOD) = Ar(\triangle GOA) \dots (i)$

Similarly,

$Ar(\triangle DPC) = Ar(\triangle BPF) \dots (ii)$

Now,

$Ar(GDF) = Ar(GOA) + Ar(BPF) + Ar(\text{pen. ABPDO})$
 $= Ar(EOD) + Ar(DPC) + Ar(\text{pen. ABPDO})$
 $= Ar(\text{pen. ABCDE})$

- Hence proved

9. In the given figure, AP is parallel to BC, BP is parallel to CQ. Prove that the area of triangles ABC and BQP are equal.

Solution:

On joining PC, we see that

$\triangle ABC$ and $\triangle BPC$ are on the same base BC and between the same parallel lines AP and BC.

$Ar(\triangle ABC) = Ar(\triangle BPC) \dots (i)$

And, $\triangle BPC$ and $\triangle BQP$ are on the same base BP and between the same parallel lines BP and CQ.

$Ar(\triangle BPC) = Ar(\triangle BQP) \dots (ii)$

From (i) and (ii), we get

$Ar(\triangle ABC) = Ar(\triangle BQP)$

- Hence proved.

10. In the figure given alongside, squares ABDE and AFGC are drawn on the side AB and the hypotenuse AC of the right triangle ABC.

If BH is perpendicular to FG prove that:

(i) $\triangle EAC \cong \triangle BAF$.

(ii) Area of the square ABDE = Area of the rectangle ARHF.

Solution:

(i) From figure,

$$\begin{aligned} \angle EAC &= \angle EAB + \angle BAC \\ &= 90^\circ + \angle BAC \dots (i) \end{aligned}$$

$$\begin{aligned} \angle BAF &= \angle FAC + \angle BAC \\ &= 90^\circ + \angle BAC \dots (ii) \end{aligned}$$

From (i) and (ii), we get

$$\angle EAC = \angle BAF$$

In $\triangle EAC$ and $\triangle BAF$, we have,

$$EA = AB$$

$$\angle EAC = \angle BAF \text{ (proved above)}$$

$$AC = AF$$

Therefore, $\triangle EAC \cong \triangle BAF$ (SAS axiom of congruency)

(ii) As $\triangle ABC$ is a right triangle, we have

$$AC^2 = AB^2 + BC^2 \quad \text{[Using Pythagoras theorem in } \triangle ABC]$$

$$AB^2 = AC^2 - BC^2$$

$$AB^2 = (AB^2 + BC^2) - [BR^2 + RC^2] \quad \text{[Since } AC^2 = AR^2 + RC^2 \text{ and using Pythagoras Theorem in } \triangle BRC]$$

$$AB^2 = AR^2 + 2AR \times RC + RC^2 - (BR^2 + RC^2) \quad \text{[Using the identity]}$$

$$AB^2 = AR^2 + 2AR \times RC + RC^2 - (AB^2 - AR^2 + RC^2) \quad \text{[Using Pythagoras Theorem in } \triangle ABR]$$

$$2AB^2 = 2AR^2 + 2AR \times RC$$

$$AB^2 = AR (AR + RC)$$

$$AB^2 = AR \times AF$$

$$\therefore \text{Area (ABDE)} = \text{Area (rectangle ARHF)}$$

11. In the following figure, DE is parallel to BC. Show that:

(i) $\text{Area}(\triangle ADC) = \text{Area}(\triangle AEB)$.

(ii) $\text{Area}(\triangle BOD) = \text{Area}(\triangle COE)$.

Solution:

(i) In $\triangle ABC$, D is midpoint of AB and E is the midpoint of AC

And, DE is parallel to BC

So, by mid-point theorem, we have

$$AD/AB = AE/AC$$

$$\text{Ar}(\triangle ADC) = \text{Ar}(\triangle BDC) = \frac{1}{2} \text{Ar}(\triangle ABC) \dots (i)$$

Again,

$$\text{Ar}(\triangle AEB) = \text{Ar}(\triangle BEC) = \frac{1}{2} \text{Ar}(\triangle ABC) \dots (ii)$$

From equations (i) and (ii), we have

$$\text{Area}(\triangle ADC) = \text{Area}(\triangle AEB).$$

- Hence Proved

(ii) We know that, area of triangles on the same base and between same parallel lines are equal

$$\text{So, Area}(\triangle DBC) = \text{Area}(\triangle BCE)$$

$$\text{Area}(\triangle DOB) + \text{Area}(\triangle BOC) = \text{Area}(\triangle BOC) + \text{Area}(\triangle COE)$$

$$\text{Thus, Area}(\triangle DOB) = \text{Area}(\triangle COE) \text{ [On subtracting Area}(\triangle BOC) \text{ on both sides]}$$

12. ABCD and BCFE are parallelograms. If area of triangle EBC = 480 cm^2 ; AB = 30 cm and BC = 40 cm; Calculate:

(i) Area of parallelogram ABCD

(ii) Area of the parallelogram BCFE

(iii) Length of altitude from A on CD

(iv) Area of triangle ECF

Solution:

(i) As $\triangle EBC$ and parallelogram $ABCD$ are on the same base BC and between the same parallels i.e., $BC \parallel AD$.

$$\begin{aligned} \text{So, Area}(\triangle EBC) &= \frac{1}{2} \text{Area}(\text{||gm } ABCD) \\ \text{Area}(\text{||gm } ABCD) &= 2 \times \text{Ar}(\triangle EBC) \\ &= 2 \times 480 \text{ cm}^2 \\ &= 960 \text{ cm}^2 \end{aligned}$$

(ii) We know that, parallelograms on same base and between same parallels are equal in area
So, Area of $BCFE$ = Area of $ABCD$ = 960 cm^2

$$\begin{aligned} \text{(iii) Area of } \triangle ACD &= 960/2 = 480 \\ &= (1/2) \times 30 \times \text{Altitude} \end{aligned}$$

$$\begin{aligned} \text{Thus,} \\ \text{Altitude} &= 480/15 \\ &= 32 \text{ cm} \end{aligned}$$

(iv) We know that, the area of a triangle is half that of a parallelogram on the same base and between the same parallels

$$\text{Therefore,} \\ \text{Area}(\triangle ECF) = \frac{1}{2} \text{Area}(\text{||gm } CBEF)$$

$$\text{Similarly,} \\ \text{Area}(\triangle BCE) = \frac{1}{2} \text{Area}(\text{||gm } CBEF)$$

$$\begin{aligned} \text{Thus,} \\ \text{Area}(\triangle ECF) &= \text{Area}(\triangle BCE) = 960/2 = 480 \text{ cm}^2 \end{aligned}$$

13. In the given figure, D is mid-point of side AB of $\triangle ABC$ and BDEC is a parallelogram.

Prove that: Area of $\triangle ABC$ = Area of ||gm BDEC.

Solution:

Here, $AD = DB$ and $EC = CB$ (Given)

So, $EC = AD$

It's seen that $\angle EFC = \angle AFD$ (Vertically opposite angles)

And, as ED and CB are parallel lines with AC cutting these lines, we have

$\angle ECF = \angle FAD$ (Alternate interior angles)

From the above conditions, we have

$\triangle EFC \cong \triangle AFD$ by AAS Congruency criterion

So, Area ($\triangle EFC$) = Area ($\triangle AFD$)

Now, adding quadrilateral $CBDF$ in both sides, we get

Area of || gm BDEC = Area of $\triangle ABC$

- Hence proved

14. In the following, $AC \parallel PS \parallel QR$ and $PQ \parallel DB \parallel SR$.

Prove that:

Area of quadrilateral PQRS = $2 \times$ Area of quad. ABCD.

Solution:

In parallelogram PQRS, $AC \parallel PS \parallel QR$ and $PQ \parallel DB \parallel SR$
Similarly, AQRC and APSC are also parallelograms.
As, $\triangle ABC$ and parallelogram AQRC are on the same base AC and between the same
parallels, we have

$$\text{Ar}(\triangle ABC) = \frac{1}{2} \text{Ar}(\text{AQRC}) \dots\dots (i)$$

Similarly,

$$\text{Ar}(\triangle ADC) = \frac{1}{2} \text{Ar}(\text{APSC}) \dots\dots (ii)$$

On adding (i) and (ii), we get

$$\text{Ar}(\triangle ABC) + \text{Ar}(\triangle ADC) = \frac{1}{2} \text{Ar}(\text{AQRC}) + \frac{1}{2} \text{Ar}(\text{APSC})$$

$$\text{Area (quad. ABCD)} = \frac{1}{2} \text{Area (quad. PQRS)}$$

Therefore,

$$\text{Area of quad. PQRS} = 2 \times \text{Area of quad. ABCD}$$

15. ABCD is trapezium with $AB \parallel DC$. A line parallel to AC intersects AB at point M and BC at point N. Prove that: area of $\triangle ADM$ = area of $\triangle ACN$.

Solution:

Given: ABCD is a trapezium

$AB \parallel CD$, $MN \parallel AC$

Let's join C and M

We know that, area of triangles on the same base and between same parallel lines are equal.

So, Area of $\triangle AMD$ = Area of $\triangle AMC$... (i)

Similarly, considering quad. AMNC where $MN \parallel AC$, we have

$\triangle ACM$ and $\triangle ACN$ are on the same base and between the same parallel lines

Thus, their areas should be equal.

i.e., Area of $\triangle ACM$ = Area of $\triangle ACN$... (ii)

From equations (i) and (ii), we get

$$\text{Area of } \triangle ADM = \text{Area of } \triangle ACN$$

- Hence Proved.

16. In the given figure, $AD \parallel BE \parallel CF$. Prove that area ($\triangle AEC$) = area ($\triangle DBF$)

Solution:

We know that,

Area of triangles on the same base and between same parallel lines are equal.

So, in ABED quadrilateral and $AD \parallel BE$

With common base, BE and between AD and BE parallel lines, we have

Area of $\triangle ABE =$ Area of $\triangle BDE$... (i)

Similarly, in BEFC quadrilateral and $BE \parallel CF$

With common base BC and between BE and CF parallel lines, we have

Area of $\triangle BEC =$ Area of $\triangle BEF$... (ii)

On adding equations (i) and (ii), we get

Area of $\triangle ABE +$ Area of $\triangle BEC =$ Area of $\triangle BEF +$ Area of $\triangle BDE$

Thus,

Area of $\triangle AEC =$ Area of $\triangle DBF$

- Hence Proved

17. In the given figure, ABCD is a parallelogram; BC is produced to point X. Prove that: area ($\triangle ABX$) = area (quad. ACXD).

Solution:

Given: ABCD is a parallelogram.

We know that,

Area of $\triangle ABC$ = Area of $\triangle ACD$ (Diagonal divides a ||gm into 2 triangles of equal area)

Now, consider $\triangle ABX$

Area of $\triangle ABX$ = Area of $\triangle ABC$ + Area of $\triangle ACX$

We also know that, area of triangles on the same base and between same parallel lines are equal.

So, Area of $\triangle ACX$ = Area of $\triangle CXD$

From above equations, we have

Area of $\triangle ABX$ = Area of $\triangle ABC$ + Area of $\triangle ACX$
 = Area of $\triangle ACD$ + Area of $\triangle CXD$
 = Area of quadrilateral ACXD

- Hence Proved

18. The given figure shows parallelograms ABCD and APQR. Show that these parallelograms are equal in area.

Solution:

Let's join B and R and also P and R.

We know that, the area of the parallelogram is equal to twice the area of the triangle, if the triangle and the parallelogram are on the same base and between the parallels

Taking ABCD parallelogram:

As ||gm ABCD and $\triangle ABR$ lie on AB and between the parallels AB and DC, we have

Area (||gm ABCD) = 2 x Area ($\triangle ABR$) ... (i)

Also, the area of triangles with same base and between the same parallel lines are equal.

As the triangles ABR and APR lie on the same base AR and between the parallels AR and QP, we have,

Area ($\triangle ABR$) = Area ($\triangle APR$) ... (ii)

From equations (i) and (ii), we have

Area ($\parallel\text{gm ABCD}$) = 2 x Area (ΔAPR) ... (iii)

Also, it's seen that ΔAPR and $\parallel\text{gm ARQP}$ lie on the same base AR and between the same parallels AR and QP

So, Area (ΔAPR) = $\frac{1}{2}$ Area ($\parallel\text{gm ARQP}$) ... (iv)

Using (iv) in (iii), we get

Area ($\parallel\text{gm ABCD}$) = 2 x $\frac{1}{2}$ x Area ($\parallel\text{gm ARQP}$)

Area ($\parallel\text{gm ABCD}$) = Area ($\parallel\text{gm ARQP}$)

- Hence proved

Exercise 16(B)

1. Show that:

(i) A diagonal divides a parallelogram into two triangles of equal area.

(ii) The ratio of the areas of two triangles of the same height is equal to the ratio of their bases.

(iii) The ratio of the areas of two triangles on the same base is equal to the ratio of their heights.

Solution:

(i) Let ABCD be a parallelogram (Given)

Considering the triangles ABC and ADC, we have

$AB = CD$ (opposite sides of $\parallel m$)

$AD = BC$ (opposite sides of $\parallel gm$)

$AC = AC$ (Common)

Thus, $\triangle ABC \cong \triangle ADC$ by SSS congruence criterion

Area of congruent triangles are equal.

Therefore, $\text{Area}(\triangle ABC) = \text{Area}(\triangle ADC)$

(ii) Consider the following figure:

Here $AP \perp BC$,

We have,

$$\text{Ar.}(\triangle ABD) = \frac{1}{2} BD \times AP$$

$$\text{And, Ar.}(\triangle ADC) = \frac{1}{2} DC \times AP$$

Thus,

$$\frac{\text{Area}(\triangle ABD)}{\text{Area}(\triangle ADC)} = \frac{(\frac{1}{2} \times BD \times AP)}{(\frac{1}{2} \times DC \times AP)} \\ = \frac{BD}{DC}$$

- Hence proved

(iii) Consider the following figure:

Here,

$$\text{Ar.}(\triangle ABC) = \frac{1}{2} BM \times AC$$

$$\text{And, Ar.}(\triangle ADC) = \frac{1}{2} DN \times AC$$

Thus,

$$\frac{\text{Area}(\triangle ABC)}{\text{Area}(\triangle ADC)} = \frac{(\frac{1}{2} \times BM \times AC)}{(\frac{1}{2} \times DN \times AC)} \\ = \frac{BM}{DN}$$

- Hence proved

2. In the given figure; AD is median of $\triangle ABC$ and E is any point on median AD. Prove that $\text{Area}(\triangle ABE) = \text{Area}(\triangle ACE)$.

Solution:

As AD is the median of $\triangle ABC$, it will divide $\triangle ABC$ into two triangles of equal areas.

So, $\text{Area}(\triangle ABD) = \text{Area}(\triangle ACD) \dots (i)$

Also, since ED is the median of $\triangle EBC$

So, $\text{Area}(\triangle EBD) = \text{Area}(\triangle ECD) \dots (ii)$

On subtracting equation (ii) from (i), we have

$\text{Area}(\triangle ABD) - \text{Area}(\triangle EBD) = \text{Area}(\triangle ACD) - \text{Area}(\triangle ECD)$

Therefore,

$\text{Area}(\triangle ABE) = \text{Area}(\triangle ACE)$

- Hence proved

**3. In the figure of question 2, if E is the midpoint of median AD, then prove that:
 $\text{Area}(\triangle ABE) = \frac{1}{4} \text{Area}(\triangle ABC)$.**

Solution:

As AD is the median of $\triangle ABC$, it will divide $\triangle ABC$ into two triangles of equal areas.

Hence, $\text{Area}(\triangle ABD) = \text{Area}(\triangle ACD)$

$\text{Area}(\triangle ABD) = \frac{1}{2} \text{Area}(\triangle ABC) \dots (i)$

In $\triangle ABD$, E is the mid-point of AD. So, BE is the median.

Thus,

$\text{Area}(\triangle BED) = \text{Area}(\triangle ABE)$

$\text{Area}(\triangle BED) = \frac{1}{2} \text{Area}(\triangle ABD)$

$\text{Area}(\triangle BED) = \frac{1}{2} \times \frac{1}{2} \text{Area}(\triangle ABC) \dots$ [From equation (i)]

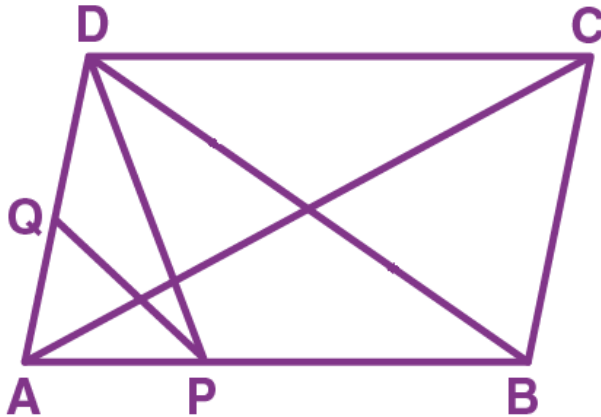

Therefore,

$\text{Area}(\triangle BED) = \frac{1}{4} \text{Area}(\triangle ABC)$

4. ABCD is a parallelogram. P and Q are the mid-points of sides AB and AD respectively. Prove that area of triangle APQ = 1/8 of the area of parallelogram ABCD.

Solution:

Let's join PD and BD.

BD is the diagonal of the parallelogram ABCD. Thus, it divides the parallelogram into two equal parts of area.

$$\begin{aligned}\text{So, Area } (\triangle ABD) &= \text{Area } (\triangle DBC) \\ &= \frac{1}{2} \text{ Area (parallelogram ABCD)} \dots \text{ (i)}\end{aligned}$$

Now,

DP is the median of $\triangle ABD$. Thus, it will divide $\triangle ABD$ into two triangles of equal areas.

$$\begin{aligned}\text{So, Area}(\triangle APD) &= \text{Area } (\triangle DPB) \\ &= \frac{1}{2} \text{ Area } (\triangle ABD) \\ &= \frac{1}{2} \times \left(\frac{1}{2} \times \text{Area (parallelogram ABCD)}\right) \quad [\text{from equation (i)}] \\ &= \frac{1}{4} \text{ Area (parallelogram ABCD)} \dots \text{ (ii)}\end{aligned}$$

Similarly,

In $\triangle APD$, Q is the mid-point of AD. Hence, PQ is the median.

$$\begin{aligned}\text{So, Area } (\triangle APQ) &= \text{Area}(\triangle DPQ) \\ &= \frac{1}{2} \text{ Area } (\triangle APD) \\ &= \frac{1}{2} \times \left(\frac{1}{4} \text{ Area (parallelogram ABCD)}\right) \quad [\text{Using equation (ii)}]\end{aligned}$$

Therefore,

$$\text{Area } (\triangle APQ) = \frac{1}{8} \text{ Area (parallelogram ABCD)}$$

- Hence proved.

5. The base BC of $\triangle ABC$ is divided at D so that $BD = \frac{1}{2} DC$.

Prove that area of $\triangle ABD = \frac{1}{3}$ rd of the area of $\triangle ABC$.

Solution:

In $\triangle ABC$, As $BD = \frac{1}{2} DC$, we have

$$BD/DC = \frac{1}{2}$$

So, $Ar(\triangle ABD) : Ar(\triangle ADC) = 1 : 2$

But, $Ar(\triangle ABD) + Ar(\triangle ADC) = Ar(\triangle ABC)$

$$Ar(\triangle ABD) + 2 Ar(\triangle ABD) = Ar(\triangle ABC)$$

$$3 Ar(\triangle ABD) = Ar(\triangle ABC)$$

Thus,

$$Ar(\triangle ABD) = \frac{1}{3} Ar(\triangle ABC)$$

6. In a parallelogram ABCD, point P lies in DC such that DP: PC = 3: 2. If area of $\triangle DPB = 30$ sq. cm, find the area of the parallelogram ABCD.

Solution:

We know that,

Ratio of area of triangles with same vertex and bases along the same line is equal to ratio of their respective bases.

So, we have

$$\text{Area } (\triangle DPB) / \text{Area } (\triangle PCB) = DP/PC = 3/2$$

Given, area of $\triangle DPB = 30$ sq. cm

Let 'x' be the area of $\triangle PCB$,

Then,

$$30/x = 3/2$$

$$x = 30/3 \times 2 = 20 \text{ sq. cm.}$$

Therefore, area of $\triangle PCB = 20$ sq. cm

Now, consider the following figure.

It is seen clearly from the diagram,
 $\text{Area}(\triangle CDB) = \text{Area}(\triangle DPB) + \text{Area}(\triangle CPB)$
 $= 30 + 20$
 $= 50 \text{ sq. cm}$

Diagonal of the parallelogram divides it into two triangles $\triangle ADB$ and $\triangle CDB$ of equal area.
 Therefore,

$$\begin{aligned} \text{Area}(\text{||gm } ABCD) &= 2 \times \triangle CDB \\ &= 2 \times 50 \\ &= 100 \text{ sq. cm} \end{aligned}$$

7. ABCD is a parallelogram in which BC is produced to E such that $CE = BC$ and AE intersects CD at F. If $\text{ar.}(\triangle DFB) = 30 \text{ cm}^2$; find the area of parallelogram.

Solution:

Given, $BC = CE$

Also, in ||gm ABCD we have

$BC = AD$

Hence, $AD = CE$

In $\triangle ADF$ and $\triangle ECF$, we have

$AD = CE$

$\angle ADF = \angle ECF$ (Alternate angles)

$\angle DAF = \angle CEF$ (Alternate angles)

Thus, $\triangle ADF \cong \triangle ECF$ by ASA congruence criterion

So, $\text{area}(\triangle ADF) = \text{area}(\triangle ECF) \dots (i)$

Also,

In $\triangle FBE$, FC is the median (As $BC = CE$)

So, $\text{Area}(\triangle BCF) = \text{Area}(\triangle ECF) \dots (ii)$

From (i) and (ii), we have

$\text{Area}(\triangle ADF) = \text{Area}(\triangle BCF) \dots (iii)$

Again,

As $\triangle ADF$ and $\triangle BDF$ are on the same base DF and between the same parallels DF and AB

$\text{Area}(\triangle BDF) = \text{Area}(\triangle ADF) \dots (iv)$

From (iii) and (iv), we have

$\text{Area}(\triangle BDF) = \text{Area}(\triangle BCF)$

Given, $\text{Area}(\triangle DFB) = 30 \text{ cm}^2$

So, $\text{Area}(\triangle BCF) = 30 \text{ cm}^2$

$\text{Area}(\triangle BCD) = \text{Area}(\triangle BDF) + \text{Area}(\triangle BCF)$

$$= (30 + 30) \text{ cm}^2$$

$$= 60 \text{ cm}^2$$

Hence,

$\text{Area of ||gm ABCD} = 2 \times \text{Area}(\triangle BCD)$

$$= 2 \times 60$$

$$= 120 \text{ cm}^2$$

8. The following figure shows a triangle ABC in which P, Q and R are mid-points of sides AB, BC and CA respectively. S is mid-point of PQ.

Prove that: $\text{ar}(\triangle ABC) = 8 \times \text{ar}(\triangle QSB)$

Solution:

In $\triangle ABC$, R and Q are the mid-points of AC and BC respectively

So, by mid-point theorem $RQ \parallel AB$

$\Rightarrow RQ \parallel PB$

So, $\text{area}(\triangle PBQ) = \text{area}(\triangle APR)$... (i) [Since $AP = PB$ and triangles on the same base and between the same parallels are equal in area]

Now,

Since P and R are the mid-points of AB and AC respectively.

By mid-point theorem, $PR \parallel BC$

$\Rightarrow PR \parallel BQ$

So, quadrilateral PMQR is a parallelogram.

Also, $\text{area}(\triangle PBQ) = \text{area}(\triangle PQR)$... (ii) [diagonal of a parallelogram divide the parallelogram in two triangles with equal area]

From (i) and (ii), we have

$\text{Area}(\triangle PQR) = \text{area}(\triangle PBQ) = \text{area}(\triangle APR)$... (iii)

Similarly, P and Q the mid-points of AB and BC respectively.

By mid-point theorem,

$PQ \parallel AC \Rightarrow PQ \parallel RC$

So, quadrilateral PQRC is a parallelogram.

Also, $\text{area}(\triangle RQC) = \text{area}(\triangle PQR)$... (iv) [Diagonal of parallelogram divide the parallelogram in two triangles with equal area]

From (iii) and (iv),

$\text{Area}(\triangle PQR) = \text{area}(\triangle PBQ) = \text{area}(\triangle RQC) = \text{area}(\triangle APR)$

So, $\text{area}(\triangle PBQ) = \frac{1}{4} \text{area}(\triangle ABC)$... (v)

Also, since S is the mid-point of PQ

BS is the median of $\triangle PBQ$

So, $\text{area}(\triangle QSB) = \frac{1}{2} \text{area}(\triangle PBQ)$

Now from (v), we have

$\text{Area}(\triangle QSB) = \frac{1}{2} \times \frac{1}{4} \text{area}(\triangle ABC)$

$\text{Area}(\triangle ABC) = 8 \times \text{area}(\triangle QSB)$

Exercise 16(C)

1. In the given figure, the diagonals AC and BD intersect at point O. If $OB = OD$ and $AB \parallel DC$, show that:

- (i) Area (ΔDOC) = Area (ΔAOB).
- (ii) Area (ΔDCB) = Area (ΔACB).
- (iii) ABCD is a parallelogram.

Solution:

(i) Ratio of area of triangles with same vertex and bases along the same line is equal to the ratio of their respective bases.

So, we have

$$\text{Area of } \Delta DOC / \text{Area of } \Delta BOC = DO/BO = 1 \dots (i)$$

Similarly,

$$\text{Area of } \Delta DOA / \text{Area of } \Delta BOA = DO/BO = 1 \dots (ii)$$

We know that area of triangles on the same base and between same parallel lines are equal.

$$\text{Area of } \Delta ACD = \text{Area of } \Delta BCD$$

$$\text{Area of } \Delta AOD + \text{Area of } \Delta DOC = \text{Area of } \Delta DOC + \text{Area of } \Delta BOC$$

$$\Rightarrow \text{Area of } \Delta AOD = \text{Area of } \Delta BOC \dots (iii)$$

From (i), (ii) and (iii) we have

$$\text{Area } (\Delta DOC) = \text{Area } (\Delta AOB)$$

- Hence Proved.

(ii) Similarly, from 1, 2 and 3, we also have

$$\text{Area of } \Delta DCB = \text{Area of } \Delta DOC + \text{Area of } \Delta BOC = \text{Area of } \Delta AOB + \text{Area of } \Delta BOC = \text{Area of } \Delta ABC$$

$$\text{So, Area of } \Delta DCB = \text{Area of } \Delta ABC$$

- Hence Proved.

(iii) We know that area of triangles on the same base and between same parallel lines are equal.

Given: triangles are equal in area on the common base, so it indicates $AD \parallel BC$.

So, ABCD is a parallelogram.
- Hence Proved

2. The given figure shows a parallelogram ABCD with area 324 sq. cm. P is a point in AB such that AP: PB = 1:2 Find The area of Δ APD.

Solution:

Ratio of area of triangles with the same vertex and bases along the same line is equal to the ratio of their respective bases.

So, we have

$$\text{Area of } \Delta\text{APD} / \text{Area of } \Delta\text{BPD} = \text{AP} / \text{BP} = \frac{1}{2}$$

$$\text{Area of parallelogram ABCD} = 324 \text{ sq.cm}$$

Area of the triangles with the same base and between the same parallels are equal.

We know that area of the triangle is half the area of the parallelogram if they lie on the same base and between the parallels.

Therefore, we have,

$$\text{Area}(\Delta\text{ABD}) = \frac{1}{2} \times \text{Area}(\text{||gm ABCD})$$

$$= 324/2$$

$$= 162 \text{ sq. cm}$$

Also, from the diagram it is clear that

$$\text{Area}(\Delta\text{ABD}) = \text{Area}(\Delta\text{APD}) + \text{Area}(\Delta\text{BPD})$$

$$162 = \text{Area}(\Delta\text{APD}) + 2 \times \text{Area}(\Delta\text{APD})$$

$$162 = 3 \times \text{Area}(\Delta\text{APD})$$

$$\text{Area}(\Delta\text{APD}) = 162/3$$

$$= 54 \text{ sq. cm}$$

(ii) Consider Δ AOP and Δ COD

$$\angle\text{AOP} = \angle\text{COD} \text{ [Vertically opposite angles]}$$

$$\angle\text{CDO} = \angle\text{APD} \text{ [AB || DC and DP is the transversal, alternate interior angles are equal]}$$

Thus, Δ AOP \sim Δ COD by AA similarity

Hence the corresponding sides are proportional.

$$\begin{aligned} AP/CD &= OP/OD \\ &= AP/AB \\ &= AP/(AP+PB) \\ &= AP/3AP \\ &= 1/3 \end{aligned}$$

Therefore, OP: OD = 1: 3

3. In $\triangle ABC$, E and F are mid-points of sides AB and AC respectively. If BF and CE intersect each other at point O, prove that the $\triangle OBC$ and quadrilateral AEOF are equal in area.

Solution:

Given, E and F are the midpoints of the sides AB and AC
Let's consider the following figure.

Therefore, by midpoint theorem

We have, $EF \parallel BC$

Triangles BEF and CEF lie on the common base EF and between the parallels, EF and BC

Therefore, $Ar(\triangle BEF) = Ar(\triangle CEF)$

$$\Rightarrow Ar(\triangle BOE) + Ar(\triangle EOF) = Ar(\triangle EOF) + Ar(\triangle COF)$$

$$Ar(\triangle BOE) = Ar(\triangle COF)$$

Now, BF and CE are the medians of the triangle ABC

And, median of the triangle divide it into two equal areas of triangles.

$$\text{Thus, } Ar(\triangle ABF) = Ar(\triangle CBF)$$

Now, subtracting $Ar(\triangle BOE)$ on the both the sides, we get

$$Ar(\triangle ABF) - Ar(\triangle BOE) = Ar(\triangle CBF) - Ar(\triangle BOE)$$

$$\text{Since, } Ar(\triangle BOE) = Ar(\triangle COF)$$

$$\Rightarrow Ar(\triangle ABF) - Ar(\triangle BOE) = Ar(\triangle CBF) - Ar(\triangle COF)$$

$$Ar(\text{quad. AEOF}) = Ar(\triangle OBC)$$

- Hence proved

4. In parallelogram ABCD, P is mid-point of AB. CP and BD intersect each other at point O. If area of $\triangle POB = 40 \text{ cm}^2$, and $OP: OC = 1: 2$, find:

(i) Areas of $\triangle BOC$ and $\triangle PBC$

(ii) Areas of $\triangle ABC$ and parallelogram ABCD.

Solution:

(i) On joining AC, we have the following figure as below

Let's consider $\triangle POB$ and $\triangle COD$

$\angle POB = \angle DOC$ [Vertically opposite angles]

$\angle OPB = \angle ODC$ [Since, $AB \parallel DC$; CP and BD are the transversal, alternate interior angles are equal]

Therefore, $\triangle POB \sim \triangle COD$ by AA similarity criterion

As, P is the midpoint

$AP = BP$ and $AB = CD$, we have $CD = 2BP$

Therefore, we have

$BP/CD = OP/OC = OB/OD = \frac{1}{2}$

$OP: OC = 1: 2$

(ii) From (i), we have

$BP/CD = OP/OC = OB/OD = \frac{1}{2}$,

Ratio between the areas of two similar triangles is equal to the ratio between the square of the corresponding sides

Here, $\triangle DOC$ and $\triangle POB$ are similar triangles.

Thus, we have

$Ar(\triangle DOC)/Ar(\triangle POB) = DC^2/PB^2$

$Ar(\triangle DOC)/Ar(\triangle POB) = (2PB)^2/PB^2$

$Ar(\triangle DOC)/Ar(\triangle POB) = 4PB^2/PB^2$

$Ar(\triangle DOC)/Ar(\triangle POB) = 4$

$Ar(\triangle DOC) = 4 \times Ar(\triangle POB)$

$$= 4 \times 40$$

$$= 160 \text{ cm}^2$$

Now, consider $\text{Ar}(\triangle DBC) = \text{Ar}(\triangle DOC) + \text{Ar}(\triangle OBC)$

$$= 160 + 80$$

$$= 240 \text{ cm}^2$$

Two triangles are equal in area if they are on the equal bases and between the same parallels

Therefore,

$$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle ABC) = 240 \text{ cm}^2$$

We know that,

Median divides the triangle into areas of two equal triangles

Thus, CP is the median of the triangle ABC.

Hence, $\text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle PBC)$

$$\text{Ar}(\triangle PBC) = \text{Ar}(\triangle ABC)/2$$

$$= 240/2$$

$$= 120 \text{ cm}^2$$

(iii) From (ii), we have

$$\text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle PBC) = 240 \text{ cm}^2$$

Area of a triangle is half the area of the parallelogram

If both are on equal bases and between the same parallels

Thus, $\text{Ar}(\triangle ABC) = \frac{1}{2} \text{Ar}(\text{||gm } ABCD)$

$$\Rightarrow \text{Ar}(\text{||gm } ABCD) = 2 \text{Ar}(\triangle ABC)$$

$$= 2 \times 240$$

$$= 480 \text{ cm}^2$$

5. The medians of a triangle ABC intersect each other at point G. If one of its medians is AD, prove that:

(i) Area ($\triangle ABD$) = 3 \times Area ($\triangle BGD$)

(ii) Area ($\triangle ACD$) = 3 \times Area ($\triangle CGD$)

(iii) Area ($\triangle BGC$) = $\frac{1}{3}$ \times Area ($\triangle ABC$)

Solution:

The figure is as shown below

We know that, medians intersect at the centroid
Given that G is the point of intersection of medians
So, G is the centroid of the triangle ABC.
Now, the centroid divides the medians in the ratio 2:1

(i) We have, $AG:GD = 2:1$

So, $\text{Area}(\triangle AGB)/\text{Area}(\triangle BGD) = 2/1$

$\text{Area}(\triangle AGB) = 2\text{Area}(\triangle BGD)$

Now, from the figure, it is clearly seen that

$\text{Area}(\triangle ABD) = \text{Area}(\triangle AGB) + \text{Area}(\triangle BGD)$

$\text{Area}(\triangle ABD) = 2 \times \text{Area}(\triangle BGD) + \text{Area}(\triangle BGD)$

Thus, $\text{Area}(\triangle ABD) = 3 \times \text{Area}(\triangle BGD) \dots (1)$

(ii) Similarly, CG divides AD in the ratio 2:1

So, $\text{Area}(\triangle AGC) / \text{Area}(\triangle CGD) = 2/1$

$\text{Area}(\triangle AGC) = 2 \times \text{Area}(\triangle CGD)$

Now, from the figure, it is clearly seen that

$\text{Area}(\triangle ACD) = \text{Area}(\triangle AGC) + \text{Area}(\triangle CGD)$

$\text{Area}(\triangle ACD) = 2 \times \text{Area}(\triangle CGD) + \text{Area}(\triangle CGD)$

Thus, $\text{Area}(\triangle ACD) = 3 \times \text{Area}(\triangle CGD) \dots (2)$

(iii) Adding equation (1) and (2), we have

$\text{Area}(\triangle ABD) + \text{Area}(\triangle ACD) = 3\text{Area}(\triangle BGD) + 3\text{Area}(\triangle CGD)$

$\text{Area}(\triangle ABC) = 3 \times [\text{Area}(\triangle BGD) + \text{Area}(\triangle CGD)]$

$\text{Area}(\triangle ABC) = 3 \times \text{Area}(\triangle BGC)$

$\text{Area}(\triangle ABC)/3 = \text{Area}(\triangle BGC)$

Thus, $\text{Area}(\triangle BGC) = 1/3 \times \text{Area}(\triangle ABC)$

6. The perimeter of a triangle ABC is 37 cm and the ratio between the lengths of its altitudes be 6 : 5 : 4. Find the lengths of its sides.

Solution:

Let's consider the sides of $\triangle ABC$ to be x cm, y cm and $(37 - x - y)$ cm

Also, let the lengths of its altitudes be $6a$ cm, $5a$ cm and $4a$ cm

We know that,

Area of a triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$

$$\Rightarrow \frac{1}{2} \times 6a = \frac{1}{2} \times y \times 5a = \frac{1}{2} \times (37 - x - y) \times 4a$$

$$6x = 5y = 148 - 4x - 4y$$

$$6x = 5y \text{ and } 6x = 148 - 4x - 4y$$

$$6x - 5y = 0 \text{ and } 10x + 4y - 148 = 0$$

Now, by solving both the equations, we have

$$x = 10 \text{ cm and } y = 12 \text{ cm}$$

$$\text{And, } (37 - x - y) = 15 \text{ cm}$$

7. In parallelogram ABCD, E is a point in AB and DE meets diagonal AC at point F. If $DF:FE = 5:3$ and area of $\triangle ADF$ is 60 cm^2 ; find

(i) Area of $\triangle ADE$

(ii) If $AE:EB = 4:5$, find the area of $\triangle ADB$

(iii) Also, find area of parallelogram ABCD

Solution:

Triangles ADF and AFE have the same vertex A and their bases are on the same straight line DE

$$\text{Hence, } \text{Ar}(\triangle ADF)/\text{Ar}(\triangle AFE) = DF/FE$$

$$60/\text{Ar}(\triangle AFE) = 5/3$$

$$\begin{aligned} \text{Ar}(\triangle AFE) &= (60 \times 3)/5 \\ &= 36 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Now, } \text{Ar}(\triangle ADE) &= \text{Ar}(\triangle ADF) + \text{Ar}(\triangle AFE) \\ &= 60 \text{ cm}^2 + 36 \text{ cm}^2 \\ &= 96 \text{ cm}^2 \end{aligned}$$

$\triangle ADE$ and $\triangle EDB$ have their bases are on the same straight line AB

$$\therefore \text{Ar}(\triangle ADE)/\text{Ar}(\triangle EDB) = AE/EB$$

$$96/\text{Ar}(\triangle EDB) = 4/5$$

$$\begin{aligned} \text{Ar}(\triangle EDB) &= (96 \times 5)/4 \\ &= 120\text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Now, Ar}(\triangle ADB) &= \text{Ar}(\triangle ADE) + \text{Ar}(\triangle EDB) \\ &= 96 \text{ cm}^2 + 120 \text{ cm}^2 \\ &= 216 \text{ cm}^2 \end{aligned}$$

Now,

$\triangle ADB$ and $\parallel^m ABCD$ are on the same base AB and between the same parallels AB and DC

$$\therefore \text{Ar}(\triangle ADB) = \frac{1}{2} \text{Ar}(\parallel^m ABCD)$$

$$216 = \frac{1}{2} \text{Ar}(\parallel^m ABCD)$$

$$\begin{aligned} \text{Thus, Ar}(\parallel^m ABCD) &= 2 \times 216 \\ &= 432 \text{ cm}^2 \end{aligned}$$

8. In the following figure, BD is parallel to CA, E is mid-point of CA and $BD = \frac{1}{2} CA$. Prove that: $\text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle DBC)$

Solution:

Here, BCED is a parallelogram, since $BD = CE$ and $BD \parallel CE$.

Now,

$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle EBC)$... (i) [Since they have the same base and area between the same parallels]

In $\triangle ABC$, we have

BE as the median

$$\text{So, Ar}(\triangle EBC) = \frac{1}{2} [\text{Ar}(\triangle EBC) + \text{Ar}(\triangle ABE)] = \frac{1}{2} \text{Ar}(\triangle ABC)$$

$$\Rightarrow \text{Ar}(\triangle ABC) = 2\text{Ar}(\triangle EBC)$$

$$\text{Therefore, Ar}(\triangle ABC) = 2\text{Ar}(\triangle DBC) \quad [\text{From (i)}]$$

9. In the following figure, OAB is a triangle and $AB \parallel DC$.

If the area of $\triangle CAD = 140 \text{ cm}^2$ and the area of $\triangle ODC = 172 \text{ cm}^2$, find
 (i) the area of $\triangle DBC$
 (ii) the area of $\triangle OAC$
 (iii) the area of $\triangle ODB$.

Solution:

Given: $\triangle CAD = 140 \text{ cm}^2$, $\triangle ODC = 172 \text{ cm}^2$ and $AB \parallel CD$

As triangles DBC and CAD have the same base CD and between the same parallel lines

Hence,

$$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle CAD) = 140 \text{ cm}^2$$

$$\begin{aligned} \text{Ar}(\triangle OAC) &= \text{Ar}(\triangle CAD) + \text{Ar}(\triangle ODC) \\ &= 140 \text{ cm}^2 + 172 \text{ cm}^2 \\ &= 312 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Ar}(\triangle ODB) &= \text{Ar}(\triangle DBC) + \text{Ar}(\triangle ODC) \\ &= 140 \text{ cm}^2 + 172 \text{ cm}^2 \\ &= 312 \text{ cm}^2 \end{aligned}$$

10. E, F, G and H are the mid-points of the sides of a parallelogram ABCD. Show that area of quadrilateral EFGH is half of the area of parallelogram ABCD.

Solution:

Let's join HF.

Since H and F are mid-points of AD and BC respectively, we have

$$AH = \frac{1}{2} AD \text{ and } BF = \frac{1}{2} BC$$

Now, ABCD is a parallelogram

$$AD = BC \text{ and } AD \parallel BC$$

$$\Rightarrow \frac{1}{2} AD = \frac{1}{2} BC \text{ and } AD \parallel BC$$

So, AH = BF and AH \parallel BF

Thus, ABFH is a parallelogram

Now,

Since parallelogram FHAB and ΔFHE are on the same base FH and between the same parallels HF and AB, we have

$$Ar(\Delta FHE) = \frac{1}{2} Ar(\parallel^m FHAB) \dots(i)$$

Similarly,

$$Ar(\Delta FHG) = \frac{1}{2} Ar(\parallel^m FHDC) \dots(ii)$$

Adding (i) and (ii), we get

$$Ar(\Delta FHE) + Ar(\Delta FHG) = \frac{1}{2} Ar(\parallel^m FHAB) + \frac{1}{2} Ar(\parallel^m FHDC)$$

$$Ar(EFGH) = \frac{1}{2} [Ar(\parallel^m FHAB) + Ar(\parallel^m FHDC)]$$

$$\therefore Ar(EFGH) = \frac{1}{2} Ar(\parallel^m ABCD)$$

11. ABCD is a trapezium with AB parallel to DC. A line parallel to AC intersects AB at X and BC at Y. Prove that area of ΔADX = area of ΔACY .

Solution:

Let's join CX, DX and AY.

Now, triangles ADX and ACX are on the same base AX and between the parallels AB and DC.

$$\therefore Ar(\Delta ADX) = Ar(\Delta ACX) \dots(i)$$

Also, triangles ACX and ACY are on the same base AC and between the parallels AC and XY.

$$\therefore Ar(\Delta ACX) = Ar(\Delta ACY) \dots(ii)$$

From (i) and (ii), we get

$$Ar(\Delta ADX) = Ar(\Delta ACY)$$

- Hence proved
