- Cartesian product of sets
- Relation
- Inverse of a relation
- Domain and range of a relation

Definition of set: A set is a well-defined collection of objects.
Let us consider the following examples

1. A collection of all the chapters in your grade 11 mathematics book.
2. A collection of all the difficult chapters in grade 11 mathematics book.

In the first case, we are getting a well-defined collection of objects, as it is the same for all the students. However, in the second case, we are not getting a well-defined collection of objects, as the difficult chapters will differ for each student. Hence it is not a set.

## Cartesian Product of Sets

Let A and B be two non-empty sets, then the cartesian product denoted by $\mathrm{A} \times \mathrm{B}$ is the ordered pair of elements. $A \times B=\{(a, b): a \in A$ and $b \in B\}$

## Examples

Find $\mathrm{A} \times \mathrm{B}, \mathrm{B} \times \mathrm{A}$ and is $\mathrm{A} \times \mathrm{B}=\mathrm{B} \times \mathrm{A}$ for the sets?
$A=\{a, b, c\}$
$B=\{1,2\}$

## Solution

$A \times B=\{(a, 1),(a, 2),(b, 1),(b, 2),(c, 1),(c, 2)\}$
$B \times A=\{(1, a),(1, b),(1, c),(2, a),(2, b),(2, c)\}$
$A \times B \neq B \times A$, Because the orders are different.

- $\{1,2\}$

## Number of elements in the Cartesian product of sets

The total number of elements in the cartesian product can be calculated as follows: If $n(A)=p$ and $n(B)=q$, then we get, cardinality of $A \times B=n(A \times B)=n(A) \times n(B)=p q$ Equivalent sets: Two sets are equivalent if they have the same number of elements.

## Relations

Let A and B be two sets. Then, relation R from A to B is a subset of $\mathrm{A} \times \mathrm{B}$.

## Examples

$$
A=\{a, b, c\} \quad B=\{1,2\}
$$

Therefore,

$$
A \times B=\{(a, 1),(a, 2),(b, 1),(b, 2),(c, 1),(c, 2)\}
$$

$R=$ Relation ending with an even number
$R=\{(\mathrm{a}, 2),(\mathrm{b}, 2),(\mathrm{c}, 2)\}$

A relation from $A$ to $B$ is expressed as follows: $R: A \rightarrow B$ It is read as $R$ is a relation such that it is from $A$ to $B$.

Number of relations from $A$ to $B=$ Number of subsets of $A \times B$ If $n(A)=p, n(B)=q$, and $R: A \rightarrow B$, then we get,
Number of relations from $A$ to $B=2^{p q}$

## Examples

$$
\begin{aligned}
& \mathrm{n}(\mathrm{~A})=3 \quad n(\mathrm{~B})=2 \\
& \Rightarrow \mathrm{n}(\mathrm{~A} \times \mathrm{B})=3 \times 2=6
\end{aligned}
$$

Number of relations from
A to $B=2^{n(A \times B)}=2^{6}$

## Domain and range of a relation

The domain of relation R is the set of the first element of all the ordered pairs of relation R . The range of relation R is the set of the second element of all the ordered pairs of relation R .

If $A=\{1,3,5,7\}, B=\{1,4,9,16,25\}$, and $R: A \rightarrow B$ such that $R=\left\{(a, b): b=a^{2}, a \in A\right.$, $\mathbf{b} \in \mathrm{B}\}$, then write relation R and also its domain and range.

## Solution

We will map the relation to find the domain and range of R .
Given, $R=\left\{(a, b): b=a^{2}, a \in A, b \in B\right\}$
$a=1 \Rightarrow b=1^{2}=1 \quad(a, b)=(1,1)$
$a=3 \Rightarrow b=3^{2}=9 \quad(a, b)=(3,9)$
$a=5 \Rightarrow b=5^{2}=25 \quad(a, b)=(5,25)$
$a=7 \Rightarrow b=7^{2}=49 \quad(a, b)=(7,49)$
Therefore,
$R=\{(1,1),(3,9),(5,25)\}$

Domain(R) $=\{1,3,5\}$
Range $(\mathrm{R})=\{1,9,25\}$

## Inverse of a relation

Let $A$ and $B$ be two sets and $R$ be a relation from $A$ to $B$. Thus, the inverse of $R$ is a relation from $B$ to $A$, which is denoted by $R^{-1}$. It is defined as follows:
$R^{-1}=\{(b, a):(a, b) \in R\}$
Basically, the position of elements in the ordered pair gets interchanged.
For example, if a relation R is $\{(\mathrm{a}, \mathrm{b})\}$, then its inverse $\mathrm{R}^{-1}$ becomes $\{(\mathrm{b}, \mathrm{a})\}$.

## Examples

Let $A$ and $B$ be two non-empty sets: $A=\{a, b, c\}, B=\{1,2\}$
$R=$ Relation ending with an even number
$R=\{(a, 2),(b, 2),(c, 2)\}$
Domain of $R=\{a, b, c\}$
Range of $R=\{2\}$
$\mathrm{R}^{-1}=\{(2, \mathrm{a}),(2, \mathrm{~b}),(2, \mathrm{c})\}$
Domain of $\mathrm{R}^{-1}=\{2\}$
Range of $R^{-1}=\{a, b, c\}$
Domain of $R^{-1}=$ Range of $R$
Range of $\mathrm{R}^{-1}=$ Domain of R

If $R=\left\{(x, y): x, y \in \mathbb{Z}, x^{2}+3 y^{2} \leq 8\right\}$ is a relation on a set of integers $\mathbb{Z}$, then find the domain of $\mathbf{R}^{-1}$.
(a) $\{-2,-1,1,2\}$
(b) $\{-1,0,1\}$
(c) $\{-2,-1,0,1,2\}$
(d) $\{0,1\}$

## Solution

Method 1: Graphical method
$x^{2}+3 y^{2}=8$
$\Rightarrow \frac{x^{2}}{8}+\frac{y^{2}}{\frac{8}{3}}=1$
$-2 \sqrt{\frac{2}{3}} \leq y \leq 2 \sqrt{\frac{2}{3}}$
$-1.6 \leq y \leq 1.6$
Integral values of $y=\{-1,0,1\}$
Domain of $\mathrm{R}^{-1}=$ Range of R
Domain of $R^{-1}=\{-1,0,1\}$
Hence, option (b) is the correct answer.

## Method 2: Algebraic method

Given, $R=\left\{(x, y): x, y \in \mathbb{Z}, x^{2}+3 y^{2} \leq 8\right\}$
We know that the domain of an inverse relation is equal to the range of an original relation.
$\Rightarrow$ Domain of $\mathrm{R}^{-1}=$ Range of R (Values of y )

## Case 1:

If $x=0$
$3 y^{2} \leq 8 \Rightarrow y^{2} \leq \frac{8}{3}$
$\Rightarrow \mathrm{y}=\{-1,0,1\}$
$[\because y \in \mathbb{Z}]$

## Case 2:

If $x= \pm 1$
$1+3 y^{2} \leq 8$
$\Rightarrow y^{2} \leq \frac{7}{3}$
$\Rightarrow \mathrm{y}=\{-1,0,1\}$
$[\because y \in \mathbb{Z}]$

Case 3:
If $\mathrm{x}= \pm 2$
$4+3 y^{2} \leq 8$
$\Rightarrow y^{2} \leq \frac{4}{3}$
$\Rightarrow \mathrm{y}=\{-1,0,1\}$
$[\because y \in \mathbb{Z}]$

## Case 4:

If $x= \pm 3$
$9+3 y^{2} \leq 28$
$\Rightarrow 3 y^{2}-1$, which is not possible.
$\mathrm{y} \in \varphi$
Therefore,
Range of $\mathrm{R}=$ Domain of $\mathrm{R}^{-1}=\{-1,0,1\}$

## Types of Relations

## Void relation

A relation R on set A is known as a void or empty relation if no element of set A is related to any element of set A.
$\Rightarrow R=\varphi$

## Example

$A=$ \{Students in a boys school $\}$
Let $R=\{(a, b): b$ is a sister of $a, a, b \in A\}$
Since A is a set of students in a boys school, there will be no girl. Therefore, relation R will not contain any element, and it will be a void relation.
$\Rightarrow \mathrm{R}=\varphi$

## Universal relation

It is a relation in which each element of set A is related to every element of set A .
$\Rightarrow R=A \times A$

## Example

Let $\mathrm{A}=\{$ Set of real numbers $\}$
$R=\{(a, b):|a-b| \geq 0, a, b \in A\}$
We know that $\mathrm{a}-\mathrm{b}$ is a real number.
So, la - $\mathrm{b} \mid$ will also be a non-negative real number.
$\Rightarrow|\mathrm{a}-\mathrm{b}| \geq 0$ will hold true for every value of a and b .
Therefore, R will be a universal relation.

## Identity relation

The relation on set A is an identity relation if each and every element of A is related to itself only.

## Example

Let $A=\{$ Set of integers $\}$
Relation $R=\{(a, b): a=b, a, b \in A\}$
Both the elements of ordered pair $(\mathrm{a}, \mathrm{b})$ are equal.
Therefore, it is an identity relation.
$\Rightarrow R=\{(a, b): a=b, a, b \in A\}=I_{A}$

## Reflexive relation

A relation $R$ on set $A$ is said to be reflexive if every element of $A$ is related to itself, i.e., relation $R$ is reflexive if $(a, a) \in R \forall a \in A$

## Note

- $I \subseteq R$, where $I$ is an identity relation on $A$.
- Every identity relation is a reflexive relation but every reflexive relation is not an identity relation.

## Example

Consider a set, $\mathrm{A}=\{1,2,3\}$
Check if the following relations are reflexive.
(1) $\mathrm{R}_{1}=\{(1,1),(1,2),(2,2),(3,3)\}$
(2) $\mathrm{R}_{2}=\{(1,1),(1,2),(2,2),(3,1)\}$
(3) $\mathrm{R}_{3}=\{(1,1),(2,2),(3,3)\}$

## Solution

(1) We have to check if every element of $A$ is related to itself or not, i.e., are $(1,1),(2,2)$, and $(3,3)$ present in relation $\mathrm{R}_{1}$ or not.
As we can see that $(1,1),(2,2)$, and $(3,3)$ are present in relation $R_{1}$, it is a reflexive relation.
(2) We have to check if every element of $A$ is related to itself or not, i.e., if $(1,1),(2,2)$,and $(3,3)$ are present in relation $R_{2}$ or not. As we can see that $(3,3)$ is not present in $R_{2}$, it is not a reflexive relation.
(3) We have to check if every element of $A$ is related to itself or not, i.e., if $(1,1),(2,2)$, and $(3,3)$ are present in relation $\mathrm{R}_{3}$ or not. As we can see that every element of set A is related to itself only, it is an identity relation. Also, we know that every identity relation is a reflexive relation. Therefore, $\mathrm{R}_{3}$ is a reflexive relation.

## Note

In an identity relation, every element of a set is related to itself only. However, in a reflexive relation, every element is related to itself and to other elements as well.

## Relation $R$ is defined on a set of natural numbers.

$R=\{(a, b)$ : a divides $b, a, b \in \mathbb{N}\}$.Check whether it is reflexive or not.

## Solution

We know that a number divides itself. So, (a, a) $\forall a \in \mathbb{N}$ will be an element of relation $R$.
Therefore, $I_{A}=\{(1,1),(2,2),(3,3), \ldots .$.$\} will be a subset of R, i.e., I_{A} \subseteq R$
$\Rightarrow R$ is a reflexive relation.

## Symmetric relation

Relation $R$ on set $A$ is said to be symmetric iff $(a, b) \in R \Rightarrow(b, a) \in R$
$\mathrm{a} R \mathrm{~b} \Rightarrow \mathrm{~b} R \mathrm{a} \forall(\mathrm{a}, \mathrm{b}) \in \mathrm{R}(\mathrm{a}, \mathrm{b} \in \mathrm{A})$
It is read as ' $a$ is related to $b$ implies that $b$ is related to a for all $(a, b) \in R$. '

## Example:

Consider a set, $\mathrm{A}=\{1,2,3\}$. Identify the symmetric relations among the following:
(1) $R_{1}=\{(1,1),(1,2),(2,1),(1,3),(3,1)\}$
(2) $R_{2}=\{(1,1),(1,2),(2,1),(1,3)\}$

## Solution

(1) Here, we have, $(1,2)$ and $(2,1) ;(1,3)$ and $(3,1)$. For $(1,1)$, we know that on interchanging the position of the first and the second element in the ordered pair ( 1,1 ), we will get ( 1,1 ). Thus, $\mathrm{R}_{1}$ is a symmetric relation.
(2) $R_{2}$ is not a symmetric relation because it does not have the corresponding ordered pair $(3,1)$ for $(1,3)$.

Relation $R$ is defined on the set of straight lines in a plane. $R=\left\{\left(L_{1}, L_{2}\right) ; L_{1} \perp L_{2}\right\}$. Check whether it is symmetric or not.

## Solution

$\left(\mathrm{L}_{1}, \mathrm{~L}_{2}\right) \in \mathrm{R} \Rightarrow \mathrm{L}_{1} \perp \mathrm{~L}_{2}$
$\Rightarrow \mathrm{L}_{2} \perp \mathrm{~L}_{1} \Rightarrow\left(\mathrm{~L}_{2}, \mathrm{~L}_{1}\right) \in \mathrm{R}$
So, the given relation is a symmetric relation.

## Transitive relation

Relation $R$ on set $A$ is said to be transitive, iff we have,
$(\mathrm{a}, \mathrm{b}) \in \mathrm{R},(\mathrm{b}, \mathrm{c}) \in \mathrm{R} \Rightarrow(\mathrm{a}, \mathrm{c}) \in \mathrm{R} \forall \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{A}$
Or aRb,bRc $\Rightarrow \mathrm{aRc}, \forall \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{A}$

## Example

Consider a set, $A=\{1,2,3\}$. Identify the transitive relations among the following:

1. $R_{1}=\{(1,1),(1,2),(2,3),(1,3)\}$
2. $R_{2}=\{(1,1),(1,3),(3,2)\}$

## Solution

(1) Consider $(1,2) \equiv(a, b)$ and $(2,3) \equiv(b, c)$
$\Rightarrow(1,3) \equiv(\mathrm{a}, \mathrm{c}) \in \mathrm{R}_{1}$
If we consider $(1,1) \equiv(a, b)$ and $(1,2) \equiv(b, c)$, then $(1,2) \equiv(a, c) \in R_{1}$
Similarly, we can check for different combinations of $a, b$, and $c$.
It comes out to be a transitive relation.
(2) Consider $(1,3) \equiv(a, b)$ and $(3,2) \equiv(b, c)$

However, $(1,2) \equiv(a, c) \notin R_{2}$
Therefore, $R_{2}$ is not a transitive relation.

Show that relation $R$ defined on the set of real numbers such that $R=\{(a, b): a>b\}$ is transitive.

## Solution

Let $(\mathrm{a}, \mathrm{b}) \in \mathrm{R}$ and $(\mathrm{b}, \mathrm{c}) \in \mathrm{R}$.
$\Rightarrow \mathrm{a}>\mathrm{b}$ and $\mathrm{b}>\mathrm{c}$
$\Rightarrow \mathrm{a}>\mathrm{c}$
$\Rightarrow(\mathrm{a}, \mathrm{c}) \in \mathrm{R}$
Therefore, R is a transitive relation.

## Equivalence Relation

Relation $R$ on a set $A$ is said to be an equivalence relation on A iff,

- It is reflexive, i.e., $(a, a) \in R \forall a \in A$
- It is symmetric, i.e., $(\mathrm{a}, \mathrm{b}) \in \mathrm{R} \Rightarrow(\mathrm{b}, \mathrm{a}) \in \mathrm{R} \forall \mathrm{a}, \mathrm{b} \in \mathrm{A}$
- It is transitive, i.e., $(a, b) \in R,(b, c) \in R \Rightarrow(a, c) \in R \forall a, b, c \in A$

## Example:

An identity relation is an equivalence relation.
Since ( $\mathrm{a}, \mathrm{a}$ ) $\in \mathrm{R} \forall \mathrm{a} \in \mathrm{A}$ $\Rightarrow$ It is an equivalence relation

Let $T$ be the set of all triangles in a plane with $R$ as a relation given by $R=\left\{\left(T_{1}, T_{2}\right)\right.$ : $T_{1}$ is congruent to $\mathrm{T}_{2}$ \}. Show that R is an equivalence relation.

## Solution

(1) Every triangle is congruent to itself.

Therefore, R is reflexive.
(2) $\left(T_{1}, T_{2}\right) \in R: T_{1}$ is congruent to $T_{2}$. $\Rightarrow \mathrm{T}_{2}$ is congruent to $\mathrm{T}_{1}$.
Therefore, R is symmetric.
(3) $\left(T_{1}, T_{2}\right) \in R: T_{1}$ is congruent to $T_{2}$.
$\left(T_{2}, T_{3}\right) \in R: T_{2}$ is congruent to $T_{3}$.
$\Rightarrow \mathrm{T}_{1}$ is congruent to $\mathrm{T}_{3}$.
Therefore, R is transitive.
Thus, the given relation R is an equivalence relation.

## Concept Check

(1) Check whether relation R defined on the set of games in a cricket tournament such that $R=\{(A, B)$ : Team A defeated Team B $\}$ is transitive.
(2) Check whether relation $R$ defined on the set of real numbers such that $R=\{(a, b): 1+a b>0\}$ is transitive.
(3) Let $\mathbb{R}$ be the set of real numbers. JEE MAIN 2011

Statement 1: $A=\{(x, y) \mathbb{R} \times \mathbb{R}: y-x$ is an integer $\}$ is an equivalence relation on $\mathbb{R}$.
Statement 2: $B=\{(x, y) \mathbb{R} \times \mathbb{R}: x=\alpha y$ for some rational number $\alpha\}$ is an equivalence relation.
(a) Statement 1 is true, statement 2 is true, and statement 2 is the correct explanation of statement 1.
(b) Statement 1 is true, statement 2 is true, and statement 1 is not the correct explanation of statement 2.
(c) Statement 1 is true and statement 2 is false.
(d) Statement 1 is false and statement 2 is true.
(4) Let $R_{1}$ and $R_{2}$ be two relations defined as follows: JEE MAIN SEP 2020
$R_{1}=\left\{(a, b) \in R \times R: a^{2}+b^{2} \in \mathbb{Q}\right\}$
$R_{2}=\left\{(a, b) \in R \times R: a^{2}+b^{2} \notin \mathbb{Q}\right\}$
Which of the following is correct?
(a) Neither $R_{1}$ nor $R_{2}$ is transitive.
(b) $R_{1}$ and $R_{2}$ are transitive.
(c) $R_{1}$ is transitive but $R_{2}$ is not.
(d) $R_{2}$ is transitive but $R_{1}$ is not.

## Summary Sheet

## Key Takeaways

- A set is a well-defined collection of objects.
- Let A and B be two non-empty sets, then the cartesian product denoted by $\mathrm{A} \times \mathrm{B}$ is the ordered pair of elements. $A \times B=\{(a, b): a \in A$ and $b \in B\}$
- The domain of relation R is the set of the first element of all the ordered pairs of relation R .
- The range of relation R is the set of the second element of all the ordered pairs of relation R .
- If $A$ and $B$ are two sets and $R$ is a relation from $A$ to $B$, then the inverse of $R$ is a relation from $B$ to $A$. It is denoted by $\mathrm{R}^{-1}$.
- In an identity relation, every element of a set is related to itself only. However, in a reflexive relation, every element is related to itself and to other elements as well.
- Relation R in set A is as follows:

| Reflexive | Not Reflexive |
| :--- | :--- |
| $\forall a \in A,(a, a) \in R$ | $\exists a \in A$ Such that $(a, a) \notin R$ |
| Symmetric | Not-symmetric |
| For $a, b \in A,(a, b) \in R \Rightarrow(b, a) \in R$ | $\exists a, b \in A,(a, b) \in R$ but $(b, a) \notin R$ |
| Transitive | Not-transitive |
| For $a, b, c \in A,(a, b),(b, c) \in R \Rightarrow(a, c) \in R$ | $a, b, b),(b, c) \in R$ but $(a, c) \notin R$ |

Domain and range of relation

| Void | Universal | Identity | Reflexive | $\begin{array}{c}\text { Symmetric } \\ \text { relation }\end{array}$ | $\begin{array}{c}\text { Transitive } \\ \text { relation }\end{array}$ | $\begin{array}{c}\text { Equivalence } \\ \text { relation }\end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| relation | relation | relation | relation | rela |  |  |

## Self-Assessment

Let $\mathrm{R}=\{(\mathrm{x}, \mathrm{y}): 2 \mathrm{x}+\mathrm{y}=41, \mathrm{x}, \mathrm{y} \in \mathbb{N}\}$ be a relation defined on the set of natural numbers. Find the domain and range of $R$.

## Concept Check

1. $(A, B) \in R \Rightarrow A$ defeated $B$
$(B, C) \in R \Rightarrow B$ defeated $C$
This does not imply that A defeated C.
Therefore, R is non-transitive.

## 3. Step 1:

Consider the following:
$(\mathrm{x}, \mathrm{x}) \in \mathrm{A}$
$\Rightarrow \mathrm{y}-\mathrm{x}=\mathrm{x}-\mathrm{x}=0$
The expression $\mathrm{y}-\mathrm{x}$ is an integer.
Thus, A is reflexive.

## Step 2:

$(x, y) \in A \Rightarrow$ The expression $y-x$ is an integer.
$(y, x) \in A \Rightarrow$ The expression $x-y$ is also an integer.
Thus, A is symmetric.

## Step 3:

$(\mathrm{x}, \mathrm{y}) \in \mathrm{A} \Rightarrow$ The expression $\mathrm{y}-\mathrm{x}$ is an integer.
$(\mathrm{y}, \mathrm{z}) \in \mathrm{A} \Rightarrow$ The expression $\mathrm{z}-\mathrm{y}$ is an integer.
$(\mathrm{x}, \mathrm{z}) \in \mathrm{A} \Rightarrow$ The expression $\mathrm{z}-\mathrm{x}$ is also an integer.
Thus, A is transitive.
Hence, A is an equivalence relation.

## Step 4:

Consider the following:
( $\mathrm{x}, \mathrm{x}$ ) $\in \mathrm{B}$
$\Rightarrow \mathrm{x}=\alpha \mathrm{x}$
$\Rightarrow \alpha=1$
Since $\alpha$ is a rational number, $B$ is reflexive.
$(x, y) \in B \Rightarrow x=\alpha y$ (For some rational $\alpha$ )
$(y, x) \in B \nRightarrow y=\alpha x$ (For some rational $\alpha$ )
(Example: $\mathrm{x}=0, \mathrm{y}=1: \mathrm{x}=\alpha \times \mathrm{y} \Rightarrow 0=\alpha \times 1=0$;

$$
y=\alpha x \Rightarrow 1=\alpha \times 0 \text { No rational exists) }
$$

Thus, $B$ is not symmetric.
Hence, $B$ is not an equivalence relation.
Thus, option (c) is the correct answer.

## Self-Assessment

We know that $\mathrm{x}, \mathrm{y} \in \mathbb{N}$
For $\mathrm{x}=1, \mathrm{y}=39$
For $\mathrm{x}=2, \mathrm{y}=37$
2. For $\mathrm{a}=-1, \mathrm{~b}=\frac{1}{2}$, we get,
$1+a b>0 \Rightarrow\left(-1, \frac{1}{2}\right) \in R$
For $\mathrm{b}=\frac{1}{2}, \mathrm{c}=4$, we get,
$1+\mathrm{bc}>0 \Rightarrow\left(\frac{1}{2}, 4\right) \in \mathrm{R}$
However,
$1+\mathrm{ac}=1+(-1) 4=-3<0 \Rightarrow(-1,4) \notin \mathrm{R}$
Therefore, R is non-transitive.

$$
\mathrm{R}_{1}=\left\{(\mathrm{a}, \mathrm{~b}) \in \mathbb{R} \times \mathbb{R}: \mathrm{a}^{2}+\mathrm{b}^{2} \in \mathbb{Q}\right\}
$$

4. $a=2+\sqrt{3}, b=2-\sqrt{3} \& c=1+2 \sqrt{3}$

$$
\begin{aligned}
a^{2}+b^{2} & =(2+\sqrt{3})^{2}+(2-\sqrt{3})^{2} \\
& =4+3+4+3=14 \in \mathbb{Q} \\
b^{2}+c^{2} & =(2-\sqrt{3})^{2}+(1+2 \sqrt{3})^{2}
\end{aligned}
$$

$$
=4+3+1+12=20 \in \mathbb{Q}
$$

$$
a^{2}+c^{2}=(2+\sqrt{3})^{2}+(1+2 \sqrt{3})^{2}
$$

$$
=4+3+1+12+4 \sqrt{3}+4 \sqrt{3}
$$

$$
=20+8 \sqrt{3} \text { is not an element of } \mathbb{Q}
$$

$\mathrm{R}_{1}$ is a non-transitive relation.
$\mathrm{R}_{2}=\left\{(\mathrm{a}, \mathrm{b}) \in \mathbb{R} \times \mathbb{R}: \mathrm{a}^{2}+\mathrm{b}^{2} \notin \mathbb{Q}\right\}$
Let
$\mathrm{a}^{2}=1, \mathrm{~b}^{2}=\sqrt{3}, \mathrm{c}^{2}=2$
$a^{2}+b^{2}=1+\sqrt{3} \notin \mathbb{Q}$
$b^{2}+c^{2}=\sqrt{3}+2 \notin \mathbb{Q}$
$\mathrm{a}^{2}+\mathrm{c}^{2}=1+2=3 \in \mathbb{Q}$
$\Rightarrow R_{2}$ is a non-transitive relation.
Option (a) is the correct answer.

For $\mathrm{x}=20, \mathrm{y}=1$
For $\mathrm{x}=21, \mathrm{y}=-1 \notin \mathbb{N}$

Therefore,
Domain of $R=\{1,2,3, \ldots . ., 20\}$
Range of $R=\{1,3,5, \ldots ., 39\}$

## INTRODUCTION TO FUNCTION

## What you already know

- Set theory
- Cartesian product
- Relations

## What you will learn

- Function
- Domain and Range
- Types of functions

A function is a relation defined from set $A$ to set $B$ when it has the following properties:
(i) Each element in A is associated to some element in B .
(ii)The association is unique.

It is denoted by $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$.
Let us consider two sets A and B .
Where $A$ is a set of all the kids and $B$ is a set of mothers of these kids as shown in the figure.
Here, the association from A to B is 'is the child of'.
Hence, all the elements of set A have to be connected to set B uniquely as more than one mother for a child is not possible.
$\therefore$ The association between A and B is a function.

## Examples

The given relation is a function. This is because all the elements of the first set are connected to the elements of the second set uniquely.

The given relation is not a function. This is because one element a of the first set is connected to two elements of the second set.

The given relation is not a function. This is because one element c of the first set is not connected to any element of the second set.

## Graphical approach

## Vertical line test

A graph is known to be a function if the vertical line drawn parallel to the Y -axis does not intersect the graph at more than one point in the domain.

## Examples

The vertical line intersects the graph of $x^{2}=y$ at one point only.
Hence, $\mathrm{x}^{2}=\mathrm{y}$ is a function.

The vertical line intersects the graph of $y^{2}=x$ at two points.
Hence, $y^{2}=x$ is not a function.

The vertical line intersects the graph of $x^{2}+y^{2}=9$ at two points.
Hence, $x^{2}+y^{2}=9$ is not a function.

The vertical line intersects the graph of $x^{3}=y$ at one point only.
Hence, $\mathrm{x}^{3}=\mathrm{y}$ is a function.

## Domain and Range

Let us try to understand the concept of domain and range of a function with the help of a juicer. In a juicer, we input fruits and get juice as the output. Similarly, a function can be compared to a juicer .

Here, all the permissible input to the function is known as domain. The outputs for the respective inputs of the function is known as range, and the possible set of outputs is known as codomain.

## Examples

Let us consider a function $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$
Domain: A
Range: $\{1,2,4\}$
Co-domain: $B=\{1,2,3,4\}$

Domain: It is the value of set A for which the function is defined.
Range: It consists of all the values that the function gives.
Co-domain: It consists of the set of all the elements in set B. (Range $\subseteq$ Codomain)

## Real valued function

If a function either has $\mathbb{R}$ or one of its subset as its range, then it is known as a real valued function. Further, if its domain is either $\mathbb{R}$ or a subset of $\mathbb{R}$, then it is known as a real function.

## Types of function

## Polynomial function

A polynomial function is given by,
$P(x)=a_{n} x^{n}+a_{n-1} x^{n-1}+\ldots \ldots . . . .+a_{0}$, where $a_{0}, a_{1}, \ldots, a_{n} \in \mathbb{R}, a_{n} \neq 0, n \in \mathbb{W}$
Domain: $x \in \mathbb{R}$
Example: $f(x)=x^{\frac{4}{3}}-1$ is not a polynomial function as $\frac{4}{3} \notin \mathbb{W}$

If $\mathrm{n}=0$, we get,
$\mathrm{f}(\mathrm{x})=\mathrm{a}_{0}$
So, in this case,
Range: $\left\{\mathrm{a}_{0}\right\}$

If $\mathrm{a}_{1}=1, \mathrm{a}_{0}=0$
$\mathrm{P}(\mathrm{x})=\mathrm{x} \rightarrow$ Identity function
Range: $\mathbb{R}$

If $\mathrm{n}=1$, we get,
$\mathrm{P}(\mathrm{x})=\mathrm{a}_{1} \mathrm{x}+\mathrm{a}_{0}$
Range: $\mathbb{R}$

If $\mathrm{n}=2$, we get,
$P(x)=a_{2} x^{2}+a_{1} x+a_{0}$
On considering the standard quadratic
polynomial function, $\mathrm{f}(\mathrm{x})=\mathrm{ax}^{2}+\mathrm{bx}+\mathrm{c}$, we get,
Let $\mathrm{f}(\mathrm{x})=\mathrm{ax}^{2}+\mathrm{bx}+\mathrm{c}$
$f(x)=a\left(x^{2}+\frac{b}{a} x+\frac{c}{a}\right)$
$=a\left[x^{2}+\frac{b}{a} x+\left(\frac{b}{2 a}\right)^{2}+\frac{c}{a}-\left(\frac{b}{2 a}\right)^{2}\right]$
$=a\left[\left(x+\frac{b}{2 a}\right)^{2}+\frac{4 a c-b^{2}}{4 a^{2}}\right]$
$=\mathrm{a}\left[\left(\mathrm{x}+\frac{\mathrm{b}}{2 \mathrm{a}}\right)^{2}-\frac{\mathrm{D}}{4 \mathrm{a}^{2}}\right]$
$\Rightarrow\left(y+\frac{D}{4 a}\right)=a\left(x+\frac{b}{2 a}\right)^{2}$

For a $>0$, we get,
Range: $\left[-\frac{D}{4 a}, \infty\right)$
For a $<0$, we get,
Range: $\left(-\infty,-\frac{D}{4 a}\right]$

## Even degree polynomial

When the degree of each term in $\mathrm{P}(\mathrm{x})$ is even, it is an even degree polynomial.

## Examples:

$P(x)=x^{2}, P(x)=x^{4}+3 x^{2}+7, P(x)=x^{6}-6 x^{4}$

## Odd degree polynomial

When the degree of each term in $\mathrm{P}(\mathrm{x})$ is odd, it is an odd degree polynomial.

## Examples:

$P(x)=x^{3}, P(x)=x^{5}+5 x^{3}+2 x, P(x)=x^{7}-6 x^{5}-x^{3}+x$

## Neither even nor odd

When the terms in $\mathrm{P}(\mathrm{x})$ are a combination of both even and odd degrees, It is neither even nor odd.

## Examples:

$P(x)=x^{4}+3 x^{3}-7 x^{2}+2 x+5$

Find the domain and range of the following: $f(x)=\sin ^{2} x+\cos ^{2} x$.

## Solution

Here, $f(x)$ is defined for all the values of $x$.
$\therefore$ Domain: $\mathrm{x} \in \mathbb{R}$
$\forall x \in \mathbb{R}, \sin ^{2} x+\cos ^{2} x=1$
$\therefore$ Range: $\mathrm{f}(\mathrm{x}) \in\{1\}$

## Solution

## Here,

$f(x)$ is defined for all the values of $x$.
$\therefore$ The domain of $f(x)$ is $x \in \mathbb{R}$.
$f(x)=x^{2}+3 x+1$
$\Rightarrow f(x)=x^{2}+3 x+\frac{9}{4}+1-\frac{9}{4}$ (To make it perfect square )
$\Rightarrow\left(x+\frac{3}{2}\right)^{2}-\frac{5}{4} \geq-\frac{5}{4}$
$\Rightarrow$ The range of the function is $f(x) \in\left[-\frac{5}{4}, \infty\right)$.

## Rational Function

A rational function is defined as $h(x)=\frac{f(x)}{g(x)}$, where $f(x)$ and $g(x)$ are the functions of $x$ and $\mathrm{g}(\mathrm{x}) \neq 0$

## Find the domain and range of the following: $f(x)=\frac{x+1}{3 x-5}$

## Solution

$f(x)=\frac{x+1}{3 x-5}$ is not defined when $3 x-5=0 \Rightarrow x=\frac{5}{3}$
$\therefore$ Domain: $x \in \mathbb{R}-\left\{\frac{5}{3}\right\}$
Let $\mathrm{y}=\frac{\mathrm{x}+1}{3 \mathrm{x}-5}$
$\Rightarrow \mathrm{x}+1=3 \mathrm{xy}-5 \mathrm{y}$
$\Rightarrow 1+5 y=3 x y-x$
$\Rightarrow x=\frac{5 y+1}{3 y-1}$
When $\mathrm{y}=\frac{1}{3}$, it is not defined.
$\therefore$ Range: $y \in \mathbb{R}-\left\{\frac{1}{3}\right\}$

## Exponential function

$y=a^{x}, a>0$

Domain: $x \in \mathbb{R}$
Range: $\mathrm{y} \in \mathbb{R}^{+}$

## Logarithmic function

$y=\log _{\mathrm{a}} \mathrm{x}, \mathrm{a}>0, \mathrm{a} \neq 1$

## Domain: $\mathrm{x} \in \mathbb{R}^{+}$

Range: $\mathrm{y} \in \mathbb{R}$

## Note

The graphs of logarithmic and exponential functions are the mirror images of each other about line $y=x$. Hence, both the functions are inverse of each other.

Find the domain and range of the following functions:
(i) $f(x)=e^{2 x}$
(ii) $f(x)=e^{x}+1$
(iii) $\log (x-2)$

## Solution

(i) $f(x)$ is defined for all the values of $x$.
$\therefore$ Domain: $\mathrm{x} \in \mathbb{R}$
$\mathrm{f}(\mathrm{x})>0, \forall \mathrm{x} \in \mathbb{R}$
$\therefore$ Range: $\mathrm{f}(\mathrm{x}) \in(0, \infty)$
(ii) $f(x)$ is defined for all the values of $x$.
$\therefore$ Domain: $\mathrm{x} \in \mathbb{R}$
$\mathrm{e}^{\mathrm{x}}>0$
$\Rightarrow \mathrm{e}^{\mathrm{x}}+1>1$
$\therefore$ Range: $\mathrm{f}(\mathrm{x}) \in(1, \infty)$
(iii) For a logarithmic function, the argument is always positive.
$\Rightarrow \mathrm{x}-2>0$
$\Rightarrow \mathrm{x}>2$
$\therefore$ Domain: $(2, \infty)$
$\therefore$ Range: $\mathrm{f}(\mathrm{x}) \in \mathbb{R}$

Find the domain of the function: $f(x)=\frac{1}{4-x^{2}}+\log _{10}\left(x^{3}-x\right)$
(a) $(1,2) \cup(2, \infty)$
(b) $(-2,-1) \cup(-1,0) \cup(2, \infty)$
(c) $(-1,0) \cup(1,2) \cup(2, \infty)$
(d) $(-1,0) \cup(1,2) \cup(3, \infty)$

## Solution

The expression $\frac{1}{4-x^{2}}$ is defined only when it satisfies the following condition:
$4-x^{2} \neq 0 \Rightarrow x \neq \pm 2 \ldots \ldots .$. (i)
The expression $\log _{10}\left(x^{3}-x\right)$ is defined only when it satisfies the following condition:
$\mathrm{x}^{3}-\mathrm{x}>0$
$\Rightarrow \mathrm{x}(\mathrm{x}-1)(\mathrm{x}+1)>0$
By using the wavy curve method, we get,
$x \in(-1,0) \cup(1, \infty)$
From equations (i) and (ii), we get,

$x \in(-1,0) \cup(1,2) \cup(2, \infty)$
$\therefore$ Option (c) is the correct answer.

## Note

In general for $\mathrm{h}(\mathrm{x})=\mathrm{f}(\mathrm{x})^{\mathrm{g}(\mathrm{x})}, \mathrm{f}(\mathrm{x})>0$ and normal condition for $\mathrm{g}(\mathrm{x})$

Find the domain of the following function: $f(x)=\left(\frac{x-1}{x-2}\right)^{3 x+4}$

## Solution

$\left(\frac{x-1}{x-2}\right)^{3 x+4}$ is in the form of $h(x)^{g(x)}$,
Here,
$g(x)=3 x+4$ is defined for $\mathbb{R}$.....(1).
$h(x)=\frac{x-1}{x-2}>0$
$\Rightarrow \frac{(x-1)(x-2)}{(x-2)^{2}}>0$
$(x-1)(x-2)>0$
By using the wavy curve method, we get the following:
$x \in(-\infty, 1) \cup(2, \infty) \ldots . .(2)$
On taking intersection of (1) and (2), we get
$x \in(-\infty, 1) \cup(2, \infty)$

## Solution

Given,
$f(x)=x^{4}+x^{2}+4$
Since $f(x)$ is a polynomial function, its domain is $\mathbb{R}$.
Let $\mathrm{y}=\mathrm{x}^{4}+\mathrm{x}^{2}+4$
$\Rightarrow y=x^{4}+x^{2}+4+\frac{1}{4}-\frac{1}{4}$ (To make it perfect square)
$\Rightarrow \mathrm{y}=\left(\mathrm{x}^{2}+\frac{1}{2}\right)^{2}+\frac{15}{4}$
$\Rightarrow \mathrm{y} \geq \frac{1}{4}+\frac{15}{4}$
$\Rightarrow \mathrm{y} \geq 4$
$\therefore$ Range: $[4, \infty)$.

## Concept Check

1. Find the domain and range of the following function: $f(x)=3 x+5$
2. Let $\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}$ be a function defined by $f(\mathrm{x})=\frac{\mathrm{x}}{\mathrm{x}^{2}+1}, \mathrm{x} \in \mathbb{R}$. Find the range of f .
(a) $\mathbb{R}-\left[-\frac{1}{2}, \frac{1}{2}\right]$
(b) $\mathbb{R}-[-1,1]$
(c) $(-1,1)-\{0\}$
(d) $\left[-\frac{1}{2}, \frac{1}{2}\right]$
3. Find the domain of the function $f(x)=\left(1+\frac{3}{x}\right)^{\frac{1}{x-2}}$
4. Find the domain of the function $f(x)=\left(x^{2}+1\right)^{\frac{x-1}{2 x-3}}$

## Summary Sheet

Key Takeaways

- A function is a relation defined from set A to set B when it has the following properties:
(i) Each element in A is associated to some element in B.
(ii) The association is unique.
- A graph is known to be a function if the vertical line drawn parallel to the Y-axis does not intersect the graph at more than one point in the domain.
- Domain: It is the value of set A for which a function is defined.
- Range: It consists of all the values that the function gives.
- Co-domain: It consists of the set of all the elements in set B. (Range $\subseteq$ Co-domain)
- If a function either has $\mathbb{R}$ or one of its subset as its range, then it is known as a real valued function. Further if domain of a function is either $\mathbb{R}$ or a subset of $\mathbb{R}$, then it is known as a real function.

| Function | Domain | Range |
| :---: | :---: | :---: |
| $\mathrm{f}(\mathrm{x})=\mathrm{a}_{0}$ <br> (Constant function) | $\mathbb{R}$ | $\left\{\mathrm{a}_{0}\right\}$ |
| $\mathrm{f}(\mathrm{x})=\mathrm{a}_{1} \mathrm{x}+\mathrm{a}_{0}$ <br> (Linear function) | $\mathbb{R}$ | $\mathbb{R}$ |
| $\mathrm{f}(\mathrm{x})=\mathrm{x}$ <br> (Identity function) | $\mathbb{R}$ | $\mathbb{R}$ |
| $\mathrm{f}(\mathrm{x})=\mathrm{a}_{2} \mathrm{x}^{2}+\mathrm{a}_{1} \mathrm{x}+\mathrm{a}_{0}$ <br> (Quadratic function) | $\mathbb{R}$ | When, $\mathrm{a}_{2}>0 ; \mathrm{R} \in\left[-\frac{\mathrm{D}}{4 \mathrm{a}_{2}}, \infty\right) \&$ When, $\mathrm{a}_{2}<0 ; \mathrm{R} \in\left(-\infty,-\frac{\mathrm{D}}{4 \mathrm{a}_{2}}\right]$ |
| $\mathrm{f}(\mathrm{x})=\mathrm{a}^{\mathrm{x}}, \mathrm{a}>0$ <br> (Exponential function) | $\mathbb{R}$ | $(0, \infty)$ |
| $\mathrm{f}(\mathrm{x})=\log _{\mathrm{a}} \mathrm{x}, \mathrm{a}>0$ <br> (Logarithmic function) | $\mathbb{R}^{+}$ | $(-\infty, \infty)$ |

## Self-Assessment

Find the range of function $f(x)=\ln \left(x^{2}-2 x+3\right)$

## Answers

## Concept Check

1. Here, $f(x)$ is defined for all the values of $x$.
$\therefore$ Domain: $\mathrm{x} \in \mathbb{R}$
Range: $f(x) \in \mathbb{R}$
2. Let $\mathrm{f}(\mathrm{x})=\mathrm{y}=\frac{\mathrm{x}}{\mathrm{x}^{2}+1}$
$\Rightarrow x=x^{2} y+y$
$\Rightarrow x^{2} y-x+y=0$
$\mathrm{x} \in \mathbb{R}$ (Given)
$\Rightarrow(-1)^{2}-4 \times \mathrm{y} \times \mathrm{y} \geq 0$
$\Rightarrow 4 y^{2}-1 \leq 0$
$\Rightarrow\left(y-\frac{1}{2}\right)\left(y+\frac{1}{2}\right) \leq 0$

By using the wavy curve method, we get,
$\mathrm{y} \in\left[-\frac{1}{2}, \frac{1}{2}\right]$
$\therefore$ Option (d) is the correct answer.
3. Given, $f(x)=\left(1+\frac{3}{x}\right)^{\frac{1}{x-2}}$

As the given $f(x)$ is in the form of $h(x)^{g(x)}$, it must satisfy following conditions: $h(x)=\left(1+\frac{3}{x}\right)>0$
and $g(x)=\frac{1}{x-2} \Rightarrow x-2 \neq 0$
$\Rightarrow \frac{(\mathrm{x}+3) \mathrm{x}}{\mathrm{x}^{2}}>0$ and
$x \neq 2$

By using the wavy curve method, we get,
$x \in(-\infty,-3) \cup(0, \infty)$ and $x \neq 2$
$\Rightarrow \mathrm{x} \in(-\infty,-3) \cup(0,2) \cup(2, \infty)$
4. To define $f(x)$, it must satisfy the following conditions:
$\mathrm{x}^{2}+1>0$ and $2 \mathrm{x}-3 \neq 0$
$\Rightarrow \mathrm{x} \in \mathbb{R}$ and $\mathrm{x} \neq \frac{3}{2}$
$\therefore$ Domain: $\mathbb{R}-\left\{\frac{3}{2}\right\}$

## Self Assessment

Given, $\mathrm{f}(\mathrm{x})=\ln \left(\mathrm{x}^{2}-2 \mathrm{x}+3\right)$
Base $=\mathrm{e}>0$ (not equal to 1 ); this means that the graph of this function will be similar to the graph of logarithmic function where a>1
We know that the functions inside log must be greater than zero.
$\Rightarrow \mathrm{x}^{2}-2 \mathrm{x}+3>0$
$\Rightarrow(\mathrm{x}-1)^{2}+2>0$
$\Rightarrow \mathrm{x}^{2}-2 \mathrm{x}+3 \geq 2$ (As $(\mathrm{x}-1)^{2} \geq 0 \forall \mathrm{x} \in \mathbb{R}$, the domain is $\mathrm{x} \in \mathbb{R}$ )
On taking $\ln$ on both the sides, we get,
$\ln \left(x^{2}-2 x+3\right) \geq \ln 2$
(In an increasing function, the inequality sign does not change)
$\mathrm{f}(\mathrm{x}) \geq \ln 2$
Range: $f(x) \in[\ln 2, \infty)$.

# RELATIONS AND FUNCTIONS 

TYPES OF FUNCTIONS

## What you already know

- Definition of a function
- Domain and range of a function

## What you will learn

- Modulus function
- Greatest integer function
- Fractional part function
- Signum function
- Trigonometric function

## Types of Functions

## Modulus function

A modulus function is a function which gives the absolute value of a number or variable. It is also termed as an absolute value function. The outcome of this function is always non-negative, no matter what input has been given to the function.

Find the domain and the range of function $f(x)=\frac{\sqrt{x^{2}}}{|x|}$

## Solution

Given, $\mathrm{f}(\mathrm{x})=\frac{\sqrt{\mathrm{x}^{2}}}{|\mathrm{x}|}$
And
$|\mathrm{x}| \neq 0$ (The denominator should not be equal to zero.)
$\Rightarrow \mathrm{x} \neq 0$
Therefore,
Domain: $\mathrm{x} \in \mathbb{R}$ - $\{0\}$
$\Rightarrow \mathrm{f}(\mathrm{x})=\frac{|\mathrm{x}|}{|\mathrm{x}|}=1$
Range: $\mathrm{y} \in\{1\}$

## Greatest integer function (G.I.F)

$y=[x]$ is the greatest integer less than or equal to x .

## Examples:

[2.3] = 2 (Greatest integer less than or equal to 2.3 is 2.)
[7.99] = 7 (Greatest integer less than or equal to 7.99 is 7.)
$[-3.7]=-4$ (Greatest integer less than or equal to -3.7 is -4 .)
$y=[x]=\left\{\begin{array}{l}0,0 \leq x<1 \\ 1,1 \leq x<2 \\ 2,2 \leq x<3 \\ 3,3 \leq x<4 \\ -1,-1 \leq x<0 \\ -2,-2 \leq x<-1 \\ -3,-3 \leq x<-2\end{array}\right.$

This is also referred as a step function.
Domain: $\mathbb{R}$
Range: $\mathrm{y} \in \mathbb{I}$ or $\mathbb{Z}[\mathbb{I}, \mathbb{Z}$ both represent the set of integers]

## Properties

- $\mathrm{x}-1<[\mathrm{x}] \leq \mathrm{x}$

## Example:

Let $\mathrm{x}=2.3$
$2.3-1<[2.3] \leq 2.3$

- $[\mathrm{x}+\mathrm{m}]=[\mathrm{x}]+\mathrm{m}$; for $\mathrm{m} \in \mathbb{Z}$

## Example:

$$
\begin{aligned}
& {[2.5+3]=[5.5]=5} \\
& \text { or }[2.5+3]=[2.5]+3
\end{aligned}
$$

$$
=2+3=5
$$

- $[\mathrm{x}]+[-\mathrm{x}]=\left\{\begin{array}{l}0, \mathrm{x} \in \mathbb{I} \\ -1, \mathrm{x} \notin \mathbb{I}\end{array}\right.$

## Example:

$[7]+[-7]=7-7=0$
$[7.1]+[-7.1]=7-8=-1$

## Find the domain and the range of $f(x)=[x+1]+1$, where [.] denotes the G.I.F.

## Solution

## Method 1: Algebraic method

$f(x)=[x+1]+1=[x]+1+1($ Using $\{[x+m]=[x]+m$, for $m \in \mathbb{Z}\})$
$\Rightarrow \mathrm{f}(\mathrm{x})=[\mathrm{x}]+2$
Domain: $x \in \mathbb{R}$, Range: $y \in \mathbb{Z}$

## Method 2: Graphical method

$\mathrm{f}(\mathrm{x})=[\mathrm{x}+1]+1$
Using $\{[\mathrm{x}+\mathrm{m}]=[\mathrm{x}]+\mathrm{m}$, for $\mathrm{m} \in \mathbb{Z}\}$, we get
$\mathrm{f}(\mathrm{x})=[\mathrm{x}+1]+1=[\mathrm{x}]+2$
$\Rightarrow \mathrm{f}(\mathrm{x})=[\mathrm{x}]+2$
Domain: $\mathrm{x} \in \mathbb{R}$
Range: $y \in \mathbb{Z}$

## Fractional part function

Any real number x can be written as $\mathrm{x}=[\mathrm{x}]+\{\mathrm{x}\}$, where [.] represents the greatest integer function and \{.\} represents the fractional part function.
$\Rightarrow\{\mathrm{x}\}=\mathrm{x}-[\mathrm{x}]$

## Graph of fractional part function

We know that
$\mathrm{y}=\{\mathrm{x}\}=\mathrm{x}-[\mathrm{x}]$
$\Rightarrow 0 \leq\{\mathrm{x}\}<1$
For plotting the graph of the fractional part function, let us break the domain into multiple parts.
Consider $0 \leq \mathrm{x}<1$
$\Rightarrow[\mathrm{x}]=0 \Rightarrow \mathrm{y}=\{\mathrm{x}\}=\mathrm{x}-0$
$\Rightarrow \mathrm{y}=\mathrm{x}$
For $1 \leq x<2$,
$[\mathrm{x}]=1 \Rightarrow \mathrm{y}=\{\mathrm{x}\}=\mathrm{x}-1$
$\Rightarrow \mathrm{y}=\mathrm{x}-1$

For $-1 \leq x<0$,
$[x]=-1 \Rightarrow y=\{x\}=x+1$
$\Rightarrow y=x+1$
Domain of the fractional part function is $x \in \mathbb{R}$
Range of the fractional part function is $y \in[0,1)$

## Properties

- $\{\mathrm{x}+\mathrm{n}\}=\{\mathrm{x}\}, \mathrm{n} \in \mathbb{Z}$

## Example:

Consider $\mathrm{x}=5.2$; then,
$\{x+3\}=\{8.2\}=0.2=\{x\}$

- $\{x\}+\{-x\}=0$, if $x \in \mathbb{Z}$
$\{x\}+\{-x\}=1$, if $x \notin \mathbb{Z}$

## Example:

Consider $x=9 \in \mathbb{Z}$; then,
$\{x\}+\{-x\}=\{9\}+\{-9\}=0+0=0$
Now, consider $\mathrm{x}=9.1 \notin \mathbb{Z}$
$\{\mathrm{x}\}+\{-\mathrm{x}\}=\{9.1\}+\{-9.1\}=0.1+0.9=1 \quad[\{-9.1\}=-9.1+10]$

Find the domain and the range of function $f(x)=2\{x+1\}+3$, where $\{$.$\} denotes the$ fractional part function.

## Solution

## Method 1: Algebraic method

Given, $\mathrm{f}(\mathrm{x})=2\{\mathrm{x}+1\}+3$, where $\{$.$\} denotes the fractional part function.$
We have,
$\mathrm{f}(\mathrm{x})=2\{\mathrm{x}+1\}+3$
$\Rightarrow \mathrm{f}(\mathrm{x})=2\{\mathrm{x}\}+3$

$$
[\because\{X+n\}=\{X\}, n \in \mathbb{Z}]
$$

Now, we know that,
$0 \leq\{x\}<1$
$\Rightarrow 0 \leq 2\{\mathrm{x}\}<2 \quad$ (Multiplying by 2 throughout the inequality)
$\Rightarrow 3 \leq 2\{\mathrm{x}\}+3<5 \quad$ (Adding 3 throughout the inequality)
Therefore, the range of $f(x)$ is $[3,5)$.
Domain: $\mathrm{x} \in \mathbb{R}$

## Method 2: Graphical method

Given, $\mathrm{f}(\mathrm{x})=2\{\mathrm{x}+1\}+3$, where $\{$.$\} denotes$ the fractional part function.
After drawing the graph, we can see that,
Domain: $\mathrm{x} \in \mathbb{R}$
Range: $y \in[3,5)$

## Signum function

$y=\operatorname{sgn}(x)= \begin{cases}\frac{|x|}{x}, & x \neq 0 \\ 0, & x=0\end{cases}$
$= \begin{cases}1, & x>0 \\ -1, & x<0 \\ 0, & x=0\end{cases}$

The domain of the signum function is $\mathbb{R}$, and the range of the signum function has only three values, i.e., $y \in\{-1,0,1\}$. The graph of the signum function is shown in the above figure.

## Note

$\operatorname{sgn}(\operatorname{sgn}(\operatorname{sgn}(. . . . . . \operatorname{sgn}(x))=\operatorname{sgn}(x)$
Explanation: Let us take $x=5$. Then,
R.H.S $=\operatorname{sgn}(5)=1$
L.H.S $=\operatorname{sgn}(\operatorname{sgn}(\operatorname{sgn}(. . . . . . . \operatorname{sgn}(5))$
$=\operatorname{sgn}(\operatorname{sgn}(\operatorname{sgn}(. . . . . . \operatorname{sgn}(1))$
$=\operatorname{sgn}(\operatorname{sgn}(\operatorname{sgn}(1))=\operatorname{sgn}(\operatorname{sgn}(1))=\operatorname{sgn}(1)=1$
$\Rightarrow$ L.H.S $=$ R.H.S

## Find the domain and the range of function $f(x)=\operatorname{sgn}\left(\frac{x^{3}+x^{2}}{x+1}\right)$

## Solution

We have,
$f(x)=\operatorname{sgn}\left(\frac{x^{3}+x^{2}}{x+1}\right)$
$\Rightarrow \mathrm{x}+1 \neq 0 \Rightarrow \mathrm{x} \neq-1 \quad(\because$ The denominator cannot be zero.)
Therefore, the domain is all real numbers except -1 , i.e., $\mathrm{x} \in \mathbb{R}-\{-1\}$
Now, let $\mathrm{y}=\mathrm{f}(\mathrm{x})$
$\Rightarrow y=\operatorname{sgn}\left(\frac{x^{3}+x^{2}}{x+1}\right)$
$y=\operatorname{sgn}\left(x^{2}\right)$
For $\mathrm{x} \neq 0$,
$\operatorname{sgn}\left(x^{2}\right)=1 \quad\left[\because x^{2}>0\right]$
For $\mathrm{x}=0$,
$\operatorname{sgn}\left(x^{2}\right)=0$
Therefore, the range of $f(x)$ is $\{0,1\}$, i.e., $y \in\{0,1\}$.

## Trigonometric Function

$\mathrm{f}(\mathrm{x})=\sin \mathrm{x}$
The graph of the sine function is

Domain: $x \in \mathbb{R}$
Range: $y \in[-1,1]$
$\mathrm{f}(\mathrm{x})=\tan \mathrm{x}$
The graph of the tangent function is

Domain: $\mathrm{x} \in \mathbb{R}-\left\{(2 \mathrm{n}+1) \frac{\pi}{2}, \mathrm{n} \in \mathbb{Z}\right\}$
Range: $\mathrm{y} \in \mathbb{R}$
$f(x)=\sec x$
The graph of the secant function is

Domain: $x \in \mathbb{R}-\left\{(2 n+1) \frac{\pi}{2}, n \in \mathbb{Z}\right\}$
Range: $y \in(-\infty,-1] \cup[1, \infty)$
$f(x)=\cos x$
The graph of the cosine function is

Domain: $\mathrm{x} \in \mathbb{R}$
Range: $y \in[-1,1]$
$f(x)=\cot x$
The graph of the cotangent function is

Domain: $\mathrm{x} \in \mathbb{R}-\{\mathrm{n} \pi, \mathrm{n} \in \mathbb{Z}\}$
Range: $y \in \mathbb{R}$
$f(x)=\operatorname{cosec} x$
The graph of the cosecant function is

Domain: $x \in \mathbb{R}-\{n \pi, n \in \mathbb{Z}\}$
Range: $y \in(-\infty,-1] \cup[1, \infty)$

## Solve $2[x]=x+2\{x\}$

## Solution

Given, $2[\mathrm{x}]=\mathrm{x}+2\{\mathrm{x}\}$
Substituting $x=\{x\}+[x]$ (i),

We get, $2[\mathrm{x}]=\{\mathrm{x}\}+[\mathrm{x}]+2\{\mathrm{x}\}$
$\Rightarrow[\mathrm{x}]=3\{\mathrm{x}\} \Rightarrow\{\mathrm{x}\}=\frac{[\mathrm{x}]}{3}$
As, $0 \leq\{x\}<1$
$\Rightarrow 0 \leq \frac{[\mathrm{x}]}{3}<1 \Rightarrow 0 \leq[\mathrm{x}]<3 \Rightarrow[\mathrm{x}]=0,1,2$
Now, we will solve the equation by taking different cases.

Case 1: When $[\mathrm{x}]=0$
Considering equations (i) and (ii), we get,
$\mathrm{x}=0+0=0$
$\mathrm{x}=0$
Case 2: When [x] = 1
Considering equations (i)
and (ii), we get,
$\mathrm{x}=\frac{1}{3}+1=\frac{4}{3}$
$\Rightarrow \mathrm{x}=\frac{4}{3}$

Case 3: When $[\mathrm{x}]=2$
Considering equations (i) and (ii), we get,
$x=\frac{2}{3}+2=\frac{8}{3}$
$\Rightarrow \mathrm{x}=\frac{8}{3}$

Thus, $\mathrm{x}=\left\{0, \frac{4}{3}, \frac{8}{3}\right\}$

It is given that $y=\operatorname{sgn}\left(x^{2}+3 x-4\right)$. find $x$ for:
(a) $y=1$
(b) $y=0$
(c) $y=-1$

## Solution

Given, $y=\operatorname{sgn}\left(x^{2}+3 x-4\right)$
$\Rightarrow y=\operatorname{sgn}[(x+4)(x-1)]$
By the definition of signum function,
$y=\operatorname{sgn}(x)= \begin{cases}1, & x>0 \\ -1, & x<0 \\ 0, & x=0\end{cases}$

```
When y = 1
=>x\in(-\infty,-4)\cup(1, \infty)
```

```
When y = 0
```

When y = 0
=> x }\in{-4,-1
When y = -1
=> x }\in(-4,-1

```

\section*{Equal or Identical Function}

Functions \(\mathrm{f}(\mathrm{x})\) and \(\mathrm{g}(\mathrm{x})\) are said to be equal or identical if,
- Domain of function \(f=\) Domain of function \(g\)
- Range of function \(f=\) Range of function \(g\)
- \(\mathrm{f}(\mathrm{x})=\mathrm{g}(\mathrm{x})\) [graphs of both the functions overlap each other]

\section*{Example}
\(\mathrm{f}(\mathrm{x})=\mathrm{x}, \mathrm{g}(\mathrm{x})=\mathrm{x}^{2} \times \frac{1}{\mathrm{x}}\)
Clearly, \(\mathrm{D}_{\mathrm{f}}=\mathbb{R}\) and \(\mathrm{D}_{\mathrm{g}}=\mathbb{R}-\{0\}\)
Thus, functions \(f\) and \(g\) are not equal.

Find whether the functions \(f(x)=1\) and \(g(x)=\sin ^{2} x+\cos ^{2} x\) are identical or not.

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})=1\) and \(\mathrm{g}(\mathrm{x})=\sin ^{2} \mathrm{x}+\cos ^{2} \mathrm{x}\)
Clearly, \(\mathrm{D}_{\mathrm{f}}=\mathbb{R}\) and \(\mathrm{D}_{\mathrm{g}}=\mathbb{R}\)
\(\mathrm{R}_{\mathrm{f}}=1=\mathrm{R}_{\mathrm{g}}\)
Thus, functions \(f\) and \(g\) are equal or identical.

\section*{Domain for Special Function}

For \({ }^{n} \mathrm{C}_{\mathrm{r}}\) and \({ }^{\mathrm{n}} \mathrm{P}_{\mathrm{r}}\) to be defined,
\(n \in \mathbb{N}, r \in \mathbb{W}, n \geq r\)

Find the range of function \(\mathrm{f}(\mathrm{x})={ }^{5-\mathrm{x}} \mathrm{C}_{3 \mathrm{x}-4}\)
(a) \(\{2\}\)
(b) \(\{3\}\)
(c) \(\{4\}\)
(d) \(\{5\}\)

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})={ }^{5-\mathrm{x}} \mathrm{C}_{3 \mathrm{x}-4}\)
As we know that,
For \({ }^{n} \mathrm{C}_{\mathrm{r}}\) and \({ }^{\mathrm{n}} \mathrm{P}_{\mathrm{r}}\) to be defined,
\(n \in \mathbb{N}, r \in \mathbb{W}, n \geq r\)
\(\Rightarrow\left\{\begin{array}{l}(5-x) \in \mathbb{N}------(i) \\ (3 x-4) \in \mathbb{W}-------(\text { ii }) \\ (5-x) \geq(3 x-4)------(\text { iii })\end{array}\right.\)
\(\Rightarrow \mathrm{x}=2\)
Now, substituting \(x=2\) in the original expression, we get,
\({ }^{3} \mathrm{C}_{2}=3\)
Hence, option (b) is the correct answer.

\section*{Concept Check}
1. Find the domain of function \(f(x)=\frac{1}{\sqrt{|x|-x}}\)
(a) \((-\infty, \infty)\)
(b) \((0, \infty)\)
(c) \((-\infty, 0)\)
(d) \((-\infty, \infty)-\{0\}\)
2. Find the range of function \(f(x)=1-|x-2|\)
(a) \((-\infty, 1]\)
(b) \((-\infty, 2]\)
(c) \((1, \infty)\)
(d) \(\left(-\infty, \frac{1}{2}\right]\)
3. Find the domain of \(f(x)=\sqrt{1-[x]^{2}}\), where [.] denotes the G.I.F.
(a) \((1,2]\)
(b) \([-1,2)\)
(c) \((1,2)\)
(d) \((-1,0)\)
4. Find the range of the following function: \(f(x)=x^{[x]}, x \in[1,3]\), where \([x]\) denotes the G.I.F.
5. Find the range of function \(f(x)=\frac{\{x\}}{1+\{x\}}\), where \(\{\).\} denotes the fractional part function.
6. Find the domain and the range of function \(f(x)=\operatorname{sgn}(9-7 \sin x)\)
(a) \(x \in \mathbb{R}, y=1\)
(b) \(x \in \mathbb{R}, y=-1\)
(c) \(x \in \mathbb{R}, y=0\)
(d) \(x \in \mathbb{R}, y \in\{1,-1\}\)
7. Find the domain of function \(f(x)=\sqrt{\sin x}+\sqrt{16-x^{2}}\).
8. Find the range of function \(f(x)=\cos ^{2} x+2 \cos x-3\).
9. Find whether the following pairs of functions are identical or not.
(a) \(f(x)=\ln e^{x}\) and \(g(x)=e^{\ln x}\)
(b) \(f(x)=\frac{1}{x}\) and \(g(x)=\frac{x}{x^{2}}\)
(c) \(f(x)=\tan x\) and \(g(x)=\frac{1}{\cot x}\)

\section*{Summary Sheet}

\section*{Key Results}
- Domain of modulus function: \(\mathrm{x} \in \mathbb{R}\)
- Range of modulus function: \(y \in \mathbb{R}^{+} U\{0\}\) or \([0, \infty)\)
- Domain of greatest integer function: \(\mathbb{R}\)
- Range of greatest integer function: \(y \in \mathbb{I}\) or \(\mathbb{Z}\)
- Domain of the fractional part function: \(x \in \mathbb{R}\)
- Range of the fractional part function: \(y \in[0,1)\)
- The domain of the signum function is \(\mathbb{R}\).
- The range of the signum function has only three values, i.e., \(\mathrm{y} \in\{-1,0,1\}\).

\section*{Mind Map}

\section*{Self-Assessment}

Find the domain and the range of function \(f(x)=x^{3}+10\).

\section*{Answers}

\section*{Concept Check}
1.

Given, function \(f(x)=\frac{1}{\sqrt{|x|-x}}\)
Clearly, \(|x|-x>0\)
Clearly, \(|x|-x>0\)
Now, we will consider different cases:
Case 1: When \(\mathrm{x} \geq 0\)
\(\Rightarrow|x|-x=x-x=0, \quad[|x|=x\), when \(x \geq 0]\)
Thus, \(x \in \varphi\)
Case 2: When \(\mathrm{x}<0\)
\(\Rightarrow|x|-\mathrm{x}=-\mathrm{x}-\mathrm{x}>0, \quad[|\mathrm{x}|=-\mathrm{x}\), when \(\mathrm{x}<0]\)
\(\Rightarrow \mathrm{x}<0\)
Thus, \(x \in(-\infty, 0)\)

So, the domain is (Case 1) \(\cup\) (Case 2)
\(\Rightarrow \mathrm{x} \in(-\infty, 0)\)
Hence, option (c) is the correct answer.
2.

\section*{Method 1: Algebraic method}

Given, \(\mathrm{f}(\mathrm{x})=1-|\mathrm{x}-2|\)
As we know that \(|\mathrm{x}| \geq 0, \forall \mathrm{x} \in \mathbb{R}\)
\(\Rightarrow|\mathrm{x}-2| \geq 0\)
Now, after multiplying by the -1 and then adding 1 , we get,
\(1-|x-2| \leq 1\)
\(\Rightarrow\) Range of function \(\mathrm{f}(\mathrm{x})=1-|\mathrm{x}-2|\) is \((-\infty, 1]\)
Hence, option (a) is the correct answer.

\section*{Method 2: Graphical method}

Given, \(\mathrm{f}(\mathrm{x})=1-|\mathrm{x}-2|\)
After drawing the figure, we can see that the span of graph on the vertical axis is \((-\infty, 1]\).
Hence, option (a) is the correct answer.

3.

\section*{Step 1:}

Given, \(\mathrm{f}(\mathrm{x})=\sqrt{1-[\mathrm{x}]^{2}}\)
Where [.] denotes the G.I.F.
Now, \(1-[\mathrm{x}]^{2} \geq 0\)
(The value inside the square root must be greater than equal to zero.)
\(\Rightarrow[\mathrm{x}]^{2}-1 \leq 0\) (Multiplying by -1 on both sides.)
\(\Rightarrow[x]^{2} \leq 1\) (Add 1 on both the sides.)

\section*{Step 2:}
\(\Rightarrow-1 \leq[\mathrm{x}] \leq 1\)
\(\Rightarrow[\mathrm{x}]=-1,0,1\)
(Only integer values are to be considered.)
\(\Rightarrow \mathrm{x} \in[-1,2)\)
So, option (b) is the correct answer.

4.

Given, \(\mathrm{f}(\mathrm{x})=\mathrm{x}^{[\mathrm{x]}]}, \mathrm{x} \in[1,3]\)
Now, we will consider different cases to solve the problem.

Case 1: When \(\mathrm{x} \in[1,2)\)
[x] = 1
\(\Rightarrow y=x^{[x]}=x^{1}\)
If \(x \in[1,2)\)
\(\Rightarrow y \in[1,2)\)

Case 2: When \(x \in[2,3)\)
[x] = 2
\(\Rightarrow y=x^{[x]}=x^{2}\)
If \(2 \leq x<3\)
\(\Rightarrow 4 \leq x^{2}<9\)
\(\Rightarrow y \in[4,9) \quad---\) (ii)

Case 3: When \(\mathrm{x}=3\)
[x] = 3
\(\Rightarrow y=x^{[x]}=3^{3}=27\)
\(\Rightarrow y \in\{27\}\)---- (iii)

The range of the given function is (i) \(U\) (ii) \(U\) (iii), i.e., \(f(x) \in[1,2) \cup[4,9) \cup\{27\}\).
5.

\section*{Step 1:}

We have,
\(\mathrm{f}(\mathrm{x})=\frac{\{\mathrm{x}\}}{1+\{\mathrm{x}\}}\)
The denominator \(1+\{x\} \neq 0\)
Therefore, the domain of \(f(x)\) is \(\mathbb{R}\).
Now, in order to find the range, let \(y=f(x)\)
\(\Rightarrow y=\frac{\{x\}}{1+\{x\}}\)
\(\Rightarrow y+y\{x\}=\{x\}\)
\(\Rightarrow\{\mathrm{x}\}=\frac{\mathrm{y}}{1-\mathrm{y}}\)

\section*{Step 2:}

We know that \(0 \leq\{x\}<1\)
\(\Rightarrow 0 \leq\{x\}<1\)
\(\Rightarrow 0 \leq \frac{y}{1-y}<1\)
\(\Rightarrow \frac{y}{1-y} \geq 0\) and \(\frac{y}{1-y}<1\)
\(\Rightarrow \frac{\mathrm{y}}{\mathrm{y}-1} \leq 0\) and \(\frac{2 \mathrm{y}-1}{1-\mathrm{y}}<0\)
\(\Rightarrow \frac{\mathrm{y}}{\mathrm{y}-1} \leq 0\) and \(\frac{2 \mathrm{y}-1}{\mathrm{y}-1}>0\)
\(\Rightarrow \mathrm{y} \in[0,1)\) and \(\mathrm{y} \in\left(-\infty, \frac{1}{2}\right) \cup(1, \infty)\)
Taking the intersection of the two obtained sets, we get,
\(y \in\left[0, \frac{1}{2}\right)\)
Therefore, the range of \(f(x)\) is \(\left[0, \frac{1}{2}\right)\).
6.

Given, \(\mathrm{f}(\mathrm{x})=\operatorname{sgn}(9-7 \sin \mathrm{x})\)
Since \(\sin \mathrm{x}\) is defined for all real numbers, domain \(\mathrm{x} \in \mathbb{R}\)
As we know that \(-1 \leq \sin x \leq 1\)
\(\Rightarrow-7 \leq 7 \sin x \leq 7\)
\(\Rightarrow 7 \geq-7 \sin x \geq-7\)
\(\Rightarrow 9+7 \geq 9-7 \sin x \geq 9-7\)
\(\Rightarrow 16 \geq 9-7 \sin x \geq 2\)
By the definition of signum function, we get
\(f(x)=\operatorname{sgn}(9-7 \sin x)=1 \forall(9-7 \sin x) \in[2,16]\)
Hence, option (a) is the correct answer.
7.

Given, \(\mathrm{f}(\mathrm{x})=\sqrt{\sin \mathrm{x}}+\sqrt{16-\mathrm{x}^{2}}\)
Clearly, \(16-x^{2} \geq 0\)
\(\Rightarrow(x-4)(x+4) \leq 0\)
\(\Rightarrow \mathrm{x} \in[-4,4]\)
Now, after drawing the graph of \(\sin \mathrm{x}\), we can see that,
Domain \(\mathrm{x} \in[-4,-\pi] \cup[0, \pi]\)

8.

Given, \(\mathrm{f}(\mathrm{x})=\cos ^{2} \mathrm{x}+2 \cos \mathrm{x}-3\)
After re-writing in terms of perfect square, we get
\(f(x)=(\cos x+1)^{2}-4\)
Now, as we know that \(-1 \leq \cos x \leq 1\)
\(\Rightarrow 0 \leq(\cos x+1) \leq 2\)
\(\Rightarrow 0 \leq(\cos x+1)^{2} \leq 4\)
\(\Rightarrow-4 \leq(\cos \mathrm{x}+1)^{2}-4 \leq 0\)
\(\Rightarrow \mathrm{f}(\mathrm{x}) \in[-4,0]\)
9.
(a) \(f(x)=\ln e^{x}\) and \(g(x)=e^{\ln x}\)

Clearly, \(\mathrm{D}_{\mathrm{f}}=\mathbb{R}\) and \(\mathrm{D}_{\mathrm{g}}=\mathbb{R}^{+}\)
Thus, functions \(f\) and \(g\) are not equal.
(b) \(f(x)=\frac{1}{x}\) and \(g(x)=\frac{x}{x^{2}}\)

Clearly, \(\mathrm{D}_{\mathrm{f}}=\mathbb{R}-\{0\}\) and \(\mathrm{D}_{\mathrm{g}}=\mathbb{R}-\{0\}\)
\(\mathrm{R}_{\mathrm{f}}=\mathbb{R}-\{0\}=\mathrm{R}_{\mathrm{g}}\)
Thus, functions f and g are equal.
(c) \(f(x)=\tan x\) and \(g(x)=\frac{1}{\cot x}=\frac{1}{\frac{\cos x}{\sin }}\)

Clearly, \(D_{f}=\mathbb{R}-\left\{(2 n+1) \frac{\pi}{2}, n \in \mathbb{Z}\right\}\) and \(D_{g}=\mathbb{R}-\left\{n \pi,(2 n+1) \frac{\pi}{2}\right.\), where \(\left.n \in \mathbb{Z}\right\}\)
Thus, functions \(f\) and \(g\) are not equal.

\section*{Self-Assessment}

\section*{Step 1:}

Since \(f(x)\) is a polynomial, its domain is \(\mathbb{R}\).
\[
\begin{aligned}
& f(x)=x^{3}+10=y \\
& y=x^{3}+10 \\
& \Rightarrow \text { Range }=\mathbb{R}
\end{aligned}
\]

\hline
\end{tabular}

\section*{Students}

Roll No.

In the above mapping, two different roll numbers cannot be allotted to the same student, so it is a one-one mapping.
A function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is said to be a one-one function if different elements of set A have different images in set \(B\).
Consider the following mappings:

In both the mappings, every element of set A is related to only one element of set B. No two elements in set A are related to the same element in set B. Therefore, both the mappings are injective or one-one.

\section*{Note}
\(f: A \rightarrow B\) is a one-one function iff same elements have the same images.

\section*{Methods to determine whether a function is one-one or not}

Let \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) be a function, \(\mathrm{x}_{1}\) and \(\mathrm{x}_{2}\) be the two elements in set A , and the corresponding images of \(x_{1}\) and \(x_{2}\) in set \(B\) be \(f\left(x_{1}\right)\) and \(f\left(x_{2}\right)\), respectively. Now, for \(f\) to be a one-one function, \(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{x}_{2}\right) \Leftrightarrow \mathrm{x}_{1}=\mathrm{x}_{2}\) or \(\mathrm{x}_{1} \neq \mathrm{x}_{2} \Leftrightarrow \mathrm{f}\left(\mathrm{x}_{1}\right) \neq \mathrm{f}\left(\mathrm{x}_{2}\right)\)

Check whether the given functions are injective or not.
(a) \(f(x)=3 x+5, f: \mathbb{R} \rightarrow \mathbb{R}\)
(b) \(f(x)=x^{2}, f: \mathbb{R} \rightarrow \mathbb{R}\)
(c) \(f(x)=x^{2}, f: \mathbb{N} \rightarrow \mathbb{N}\)

\section*{Solution}
(a)

Let \(\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathbb{R}\)
\(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{x}_{2}\right)\)
\(\Rightarrow 3 \mathrm{x}_{1}+5=3 \mathrm{x}_{2}+5\)
\(\Rightarrow 3 \mathrm{x}_{1}=3 \mathrm{x}_{2}\)
\(\Rightarrow \mathrm{x}_{1}=\mathrm{x}_{2}\)
Therefore, the given function is a one-one function.
(b)

Let \(\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathbb{R}\)
\(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{X}_{2}\right)\)
\(\Rightarrow \mathrm{x}_{1}{ }^{2}=\mathrm{x}_{2}{ }^{2}\)
\(\Rightarrow \mathrm{x}_{1}{ }^{2}-\mathrm{x}_{2}{ }^{2}=0\)
\(\Rightarrow\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\left(\mathrm{x}_{1}+\mathrm{x}_{2}\right)=0\)
\(x_{1}=x_{2}\) or \(x_{1}=-x_{2}\)
Here, we get the same output with two different inputs.
Therefore, it is not a one-one function.
\[
\begin{aligned}
& x_{1}=-1 \Rightarrow f(-1)=1 \\
& x_{2}=1 \Rightarrow f(1)=1
\end{aligned}
\]
(c)

Let \(\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathbb{N}\)
\(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{X}_{2}\right)\)
\(\Rightarrow \mathrm{x}_{1}{ }^{2}=\mathrm{x}_{2}{ }^{2}\)
\(\Rightarrow \mathrm{x}_{1}^{2}-\mathrm{x}_{2}^{2}=0\)
\(\Rightarrow\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\left(\mathrm{x}_{1}+\mathrm{x}_{2}\right)=0\)
\(\Rightarrow \mathrm{x}_{1}=\mathrm{x}_{2}\) or \(\mathrm{x}_{1} \neq-\mathrm{x}_{2} \quad\left[\because \mathrm{x}_{1}, \mathrm{x}_{2} \in \mathbb{N}\right]\)
Therefore, the given function is a one-one function.

Students
Score

Two different students can get the same marks, therefore the above mapping is many-one.
A function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is said to be a many-one function if there exists at least two or more elements of set A that have the same image in set B.
Consider the following mappings:
A

A
B

In both the mappings, two elements of set A have the same image in set B. Therefore, both the mappings are many-one.

\section*{Methods to determine whether a function is one-one or many-one}

For a function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) to be many-one, there must be at least two elements, \(\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathrm{~A}\) such that \(f\left(x_{1}\right)=f\left(x_{2}\right), f\left(x_{1}\right), f\left(x_{2}\right) \in B\), but \(x_{1}=x_{2}\) will not be the only condition for that to happen.

Example: Consider a function \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}\) such that \(\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}+\mathrm{x}+2\)
Let \(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{x}_{2}\right), \mathrm{x}_{1}, \mathrm{x}_{2} \in \mathbb{R}\)
\(\Rightarrow \mathrm{x}_{1}{ }^{2}+\mathrm{x}_{1}+2=\mathrm{x}_{2}{ }^{2}+\mathrm{x}_{2}+2\)
\(\Rightarrow\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\left(\mathrm{x}_{1}+\mathrm{x}_{2}+1\right)=0\)
\(\Rightarrow x_{1}=x_{2}\) or \(x_{1}+x_{2}+1=0\)
Here, \(x_{1}=x_{2}\) is not the only condition that we get. It implies that there are other \(x_{1}, x_{2}\) conditions for which \(f\left(x_{1}\right)=f\left(x_{2}\right)\) holds true. Therefore, the given function is a many-one function.

\section*{Note}

If a function is one-one, then it cannot be many-one and vice versa.

\section*{Graphical Test}

\section*{Horizontal line test}

If we draw straight lines parallel to X-axis, and they cut the graph of the function at exactly one point, then the function is one-one.
Example: Consider the functions, \(f(x)=3 x+5\) and \(f(x)=x^{3}, f: \mathbb{R} \rightarrow \mathbb{R}\)
Both \(f(x)=3 x+5\) and \(f(x)=x^{3}\) have only one point of intersection with the line parallel to the X-axis. Therefore, they are one-one functions.

If there exists a straight line parallel to the X-axis, which cuts the graph of the function at two or more points, then the function is many-one.

\section*{Example:}
- Consider \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}, \mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}\)

The function \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}\) has more than two points of intersection with the line parallel to the X -axis. Therefore, it is a many-one function.

- Consider \(f(x)=x^{2}, f: \mathbb{R} \rightarrow \mathbb{R}\)

The function \(\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}\) has two points of intersection with the line parallel to the X -axis. Therefore, it is a many-one function.

Identify the following function as one-one or many-one. \(f(x)=2 \tan x ; f:\left(\frac{\pi}{2}, \frac{3 \pi}{2}\right) \rightarrow \mathbb{R}\)

\section*{Solution}

Observe that the domain is restricted to
\(\left(\frac{\pi}{2}, \frac{3 \pi}{2}\right)\).
Clearly, the given function has only one point of intersection with the lines parallel to the X-axis. Therefore, it is a one-one function.

Identify the following function as one-one or many-one.
\(\mathrm{f}(\mathrm{x})=|\log \mathrm{x}|\)

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})=|\log \mathrm{x}|\)
Clearly, the given function has more than two points of intersection with the lines parallel to the X-axis. Therefore, it is a many-one function.

\section*{Number of Functions}

Let a function be \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\)
\(A=\left\{x_{1}, x_{2}, x_{3}, x_{4}\right\}, B=\left\{y_{1}, y_{2}, y_{3}, y_{4}, y_{5}\right\}\)
\(n(A)=4\) and \(n(B)=5\).
Each element of \(A\) can choose one element out of the five elements from B.
Thus, total number of functions from A to B is \(5 \times 5 \times 5 \times 5=5^{4}\)
Generally, if \(n(A)=m\) and \(n(B)=n\),
Then, the total number of functions from \(A\) to \(B\) is \(n \times n \times \ldots . m\) times \(=n^{m}\)

\section*{Number of one-one functions}

Let a function be \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\)
\(A=\left\{x_{1}, x_{2}, x_{3}, x_{4}\right\}, B=\left\{y_{1}, y_{2}, y_{3}, y_{4}, y_{5}\right\}\)
\(\mathrm{n}(\mathrm{A})=4\) and \(\mathrm{n}(\mathrm{B})=5\)
Here, \(x_{1}\) has to choose one out of five \(\left\{y_{1}, y_{2}, y_{3}, y_{4}, y_{5}\right\}\).
Let us say \(\mathrm{X}_{1}\) chose \(\mathrm{y}_{5}\) ( 5 ways).
Now, \(x_{2}\) has to choose one out of four \(\left\{y_{1}, y_{2}, y_{3}, y_{4}\right\}\).
Let us say \(x_{2}\) chose \(y_{4}\) ( 4 ways).
Now, \(x_{3}\) has to choose one out of three \(\left\{y_{1}, y_{2}, y_{3}\right\}\).
Let us say \(x_{3}\) chose \(y_{2}\) ( 3 ways).
Now, \(x_{4}\) has to choose one out of two \(\left\{y_{1}, y_{3}\right\}\). i.e 2 ways.
\(\therefore\) Number of one-one mappings \(=5 \times 4 \times 3 \times 2=5(5-1)(5-2)(5-3)={ }^{5} \mathrm{P}_{4}={ }^{5} \mathrm{C}_{4} \times 4\) ! (Selection of any four outputs and arranging them)
Generally, if \(n(A)=m\) and \(n(B)=n\), then the number of one-one mappings will be the following:
(a) If \(n \geq m\), then \({ }^{n} P_{m}\)
(b) If \(\mathrm{n}<\mathrm{m}\), then one-one function does not exist \(=0\)

Consider a function, \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\)
\(A=\left\{x_{1}, x_{2}, x_{3}\right\}, B=\left\{y_{1}, y_{2}\right\}\)
\(\mathrm{n}(\mathrm{A})=3\) and \(\mathrm{n}(\mathrm{B})=2\)
Here, \(\mathrm{x}_{1}\) has to choose one out of two \(\left\{\mathrm{y}_{1}, \mathrm{y}_{2}\right\}\).

Let us say \(\mathrm{x}_{1}\) chose \(\mathrm{y}_{2}\).
Now, \(x_{2}\) has only single option \(y_{1}\).
Also, \(x_{3}\) has no choice.
Number of one-one mappings \(=2 \times 1 \times 0=0\)

\section*{Note}

Number of many-one functions \(=\) (Total number of functions) - (Number of one-one functions) In general, if \(n(A)=m\) and \(n(B)=n\), then the number of many-one mappings is \(n^{m}-{ }^{n} P_{m}\).

JEE MAIN-2020 (Sept)
Let \(A=\{a, b, c\}\) and \(B=\{1,2,3,4\}\). Find the number of elements in the set \(C=\{f: A \rightarrow B \mid\) \(2 \in f(A)\) and \(f\) is not one-one \(\}\)

\section*{Solution}

Here, f is not one-one and \(2 \in \mathrm{f}(\mathrm{A})\).
We cannot consider three or more elements in set B as set A has three elements. 2 in B has to be considered always.
Hence, we have two cases.

\section*{B}
1
2
3
4

A

B

\section*{Case 2:}
\(f\) has only two images (' 2 ' has to be there)
The number of elements in \(C\) will be \({ }^{3} \mathrm{C}_{1}\left\{2^{3}-2\right\}\).
\({ }^{3} \mathrm{C}_{1}\) (To select one more image except the element ' 2 ' from B)
\(2^{3}\) (Total number of functions from A to B)
2 (Two cases where all the elements of A map to either of two elements in B)

Subtracting 2 is necessary because of the following reasons:
Firstly, if all the elements of A are mapped to 2 in B, it becomes re-counting as this is exactly in case 1.
The other case is where all the elements of A are mapped to the other chosen element in B.
This is not allowed as 2 has to be in the range of f .
Number of elements in \(\mathrm{C}={ }^{3} \mathrm{C}_{1}\left\{2^{3}-2\right\}=18\)
Total number of elements in \(\mathrm{C}=(\) Case 1\()+(\) Case 2\()=1+18=19\)

Check if the function, \(f: \mathbb{R} \rightarrow \mathbb{R}\), is one-one or many-one, where \(f(x)=\frac{x^{2}+4 x+7}{x^{2}+x+1}\)

\section*{Solution}

\section*{Method 1}

Given, \(f: \mathbb{R} \rightarrow \mathbb{R}\), where \(f(x)=\frac{x^{2}+4 x+7}{x^{2}+x+1}\)
\(\Rightarrow \mathrm{f}(1)=\frac{1+4+7}{1+1+1}=4\), and \(\mathrm{f}(-1)=\frac{1-4+7}{1-1+1}=4\)
Thus, the given function is a many-one function.

\section*{Method 2}

Given, \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}\), where \(\mathrm{f}(\mathrm{x})=\frac{\mathrm{x}^{2}+4 \mathrm{x}+7}{\mathrm{x}^{2}+\mathrm{x}+1}\)
\[
\begin{aligned}
\mathrm{f}\left(\mathrm{x}_{1}\right) \mathrm{f}\left(\mathrm{x}_{2}\right) & \Rightarrow \frac{\mathrm{x}_{1}{ }^{2}+4 \mathrm{x}_{1}+7}{\mathrm{x}_{1}{ }^{2}+\mathrm{x}_{1}+1}=\frac{\mathrm{x}_{2}{ }^{2}+4 \mathrm{x}_{2}+7}{\mathrm{x}_{2}{ }^{2}+\mathrm{x}_{2}+1} \\
\Rightarrow & \mathrm{x}_{1}^{2} \mathrm{x}_{2}{ }^{2}+\mathrm{x}_{1}{ }^{2} \mathrm{x}_{2}+\mathrm{x}_{1}{ }^{2}+4 \mathrm{x}_{1} \mathrm{x}_{2}^{2}+4 \mathrm{x}_{1} \mathrm{x}_{2}+4 \mathrm{x}_{1}+7 \mathrm{x}_{2}{ }^{2}+7 \mathrm{x}_{2}+7 \\
& =\mathrm{x}_{1}^{2} \mathrm{x}_{2}{ }^{2}+4 \mathrm{x}_{1}{ }^{2} \mathrm{x}_{2}+7 \mathrm{x}_{1}^{2}+\mathrm{x}_{1} \mathrm{x}_{2}^{2}+4 \mathrm{x}_{1} \mathrm{x}_{2}+7 \mathrm{x}_{1}+\mathrm{x}_{2}{ }^{2}+4 \mathrm{x}_{2}+7 \\
\Rightarrow & 3 \mathrm{x}_{1}{ }^{2} \mathrm{x}_{2}+6 \mathrm{x}_{1}{ }^{2}-3 \mathrm{x}_{1} \mathrm{x}_{2}^{2}+3 \mathrm{x}_{1}-6 \mathrm{x}_{2}^{2}-3 \mathrm{x}_{2}=0 \\
\Rightarrow & 3 \mathrm{x}_{1} \mathrm{x}_{2}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)+6\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\left(\mathrm{x}_{1}+\mathrm{x}_{2}\right)+3\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)=0 \\
\Rightarrow & \left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\left(3 \mathrm{x}_{1} \mathrm{x}_{2}+6 \mathrm{x}_{1}+6 \mathrm{x}_{2}+3\right)=0 \\
\Rightarrow & \mathrm{x}_{1}=\mathrm{x}_{2} \text { or } \mathrm{x}_{1}=\frac{-\left(2 \mathrm{x}_{2}+1\right)}{\mathrm{x}_{2}+2}
\end{aligned}
\]

Thus, the given function is a many - one function.

\section*{Concept Check}
1. Check whether the given functions are one-one or many-one functions.
(a) \(y=\log _{2} x, x>0\)
(b) \(y=\{x\}, x \in \mathbb{R}\)
(c) \(y=a^{x}, x \in \mathbb{R}\)
(d) \(y=\operatorname{sgn}(x), x \in \mathbb{R}\)
2. Identify the following function as one-one or many-one: \(f(x)=\sqrt{\left(1-e^{\left(\frac{1}{x}-1\right)}\right)} ;(x \neq 0)\) in its domain.
3. If \(A=\{1,2,3,4\}\), then find the number of functions on set \(A\) that are not one-one.

JEE MAIN-2020 (Jan)
(a) 240
(b) 248
(c) 232
(d) 256
4. Let x denote the total number of one-one functions from set A with 3 elements to set B with 5 elements, and let y denote the total number of one-one functions from set A to set \(\mathrm{A} \times \mathrm{B}\). Which of the following is correct?
(a) \(y=273 x\)
(b) \(2 y=91 x\)
(c) \(y=91 x\)
(d) \(2 y=273 x\)

\section*{Summary Sheet}

\section*{Key Takeaways}

\section*{Horizontal line test}
» If we draw a straight line parallel to the X-axis, and when it intersects the graph of the function at exactly one point, then the function is one-one.
" If there exists a straight line parallel to the X-axis, which cuts the graph of the function at two or more points, then the function is many-one.
- If \(n(A)=m\) and \(n(B)=n\), then

Total number of functions from \(A\) to \(B\) is \(n \times n \times \ldots . m\) times \(=n^{m}\)
- If \(n(A)=m\) and \(n(B)=n\) then the number of one-one mappings is
" \({ }^{n} P_{m}\); where \(\mathrm{n} \geq \mathrm{m}\)
» 0 , (one-one function does not exist) ; where \(\mathrm{n}<\mathrm{m}\)
- The number of many-one mappings is \(\mathrm{n}^{\mathrm{m}}\) - \({ }^{\mathrm{n}} \mathrm{P}_{\mathrm{m}}\).

\section*{Mind Map}

\section*{Self-Assessment}

Identify \(f(x)=|x| x^{2}, x \in \mathbb{R}\) as a one-one or a many-one function.

\section*{Concept Check}
1. (a) Given, \(y=\log _{2} x, x>0\)

Clearly, the given function has only one point of intersection with the line parallel to the X -axis. Therefore, it is a one-one function.
(c) Given, \(\mathrm{y}=\mathrm{a}^{\mathrm{x}}, \mathrm{x} \in \mathbb{R}\)

Clearly, the given function has only one point of intersection with the line parallel to the X-axis. Therefore, it is a one-one function.
(b) Given, \(y=\{x\}, x \in \mathbb{R}\)

Clearly, the given function has more than one points of intersection with the line parallel to the X-axis. Therefore, it is a many-one function.
(d) Given, \(y=\operatorname{sgn}(x), x \in \mathbb{R}\)

Clearly, the given function has more than one points of intersection with the line parallel to the X -axis. Therefore, it is a many-one function.
2.

Consider
\(\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{x}_{2}\right) ; \mathrm{x}_{1}, \mathrm{x}_{2}\) in the domain
\(\Rightarrow \sqrt{\left(1-\mathrm{e}^{\left(\frac{1}{x_{1}}-1\right)}\right)}=\sqrt{\left(1-\mathrm{e}^{\left(\frac{1}{x_{2}}-1\right)}\right)}\)
On squaring both the sides, we get,
\(\Rightarrow\left(1-\mathrm{e}^{\left(\frac{1}{x_{1}}-1\right)}\right)=\left(1-\mathrm{e}^{\left(\frac{1}{x_{2}}-1\right)}\right)\)
\(e^{\frac{1}{x_{1}}}=e^{\frac{1}{x_{2}}}\)
From the graph, we can observe the following:

\(\frac{1}{\mathrm{x}_{1}}=\frac{1}{\mathrm{x}_{2}} \Rightarrow \mathrm{x}_{1}=\mathrm{x}_{2}\)
Hence, the given function is a one - one function.
3.

Number of not one-one functions \(=\) (Total number of functions) - (Number of one-one functions)
\(=\mathrm{n}^{\mathrm{m}}-{ }^{\mathrm{n}} \mathrm{P}_{\mathrm{m}}\)
Here, \(\mathrm{n}=\mathrm{m}=4\)
Number of non-one-one functions \(=4^{4}-{ }^{4} \mathrm{P}_{4}=256-24=232\)
Hence, option (c) is the correct answer.
4.

Given,
\(\mathrm{n}(\mathrm{A})=3\)
\(n(B)=5\)
\(\mathrm{n}(\mathrm{A} \times \mathrm{B})=15\)
Here,
\(x=\) Total number of one-one functions from set A to set \(B=5 \times 4 \times 3 \quad--\)-(i)
\(y=\) Total number of one-one functions from set A to set \(A \times B=15 \times 14 \times 13\)
\(\Rightarrow 2 \mathrm{y}=91 \mathrm{x}\)
Hence, option (b) is the correct answer.

\section*{Self-Assessment}

\section*{Method 1}

Given, \(\mathrm{f}(\mathrm{x})=|\mathrm{x}| \mathrm{x}^{2}\)
\(y=|x| x^{2}= \begin{cases}x^{3}, & x \geq 0 \\ -x^{3}, & x<0\end{cases}\)

Clearly, a line drawn parallel to the X-axis intersects the graph at two distinct points. Therefore, the given function will not be a one-one function.

\section*{Method 2}
\(f(1)=1, f(-1)=1\)
Hence, not a one-one function.

\section*{M A T H E M A T | C S \\ RELATIONS AND FUNCTIONS}

ONTO AND INTO FUNCTIONS

\section*{What you already know}
- Definition of a function
- Domain and range of a function
- Different types of functions

\section*{What you will learn}
- Classification of functions
- Principle of inclusion and exclusion
- Number of onto functions

Let us consider two sets, A and B ,
Where \(A\) is a set of children and \(B\) is a set of women.
The association from A to B refers to 'is the child of'.
Hence, all the elements of set A have to be connected to set B uniquely, as there cannot be a possibility of a child having more than one mother.
Now, let us discuss the two situations.

\section*{Situation 1:}

Here, we can see that woman 2 is not connected to any child of the set A.
Hence,
Range \(=\{1,3,4\}\)
Codomain \(=\{1,2,3,4\}\)
\(\Rightarrow\) Range \(\subset\) Codomain
Such a function is known as an into function.

\section*{Situation 2:}

In this case, all the women (elements of set B) are connected to at least one element of set A.
Hence,
Range \(=\{1,2,3,4\}\)
Codomain \(=\{1,2,3,4\}\)
\(\Rightarrow\) Range \(=\) Codomain
Such a function is known as an onto function or surjective function.

\section*{Onto function (Surjective mapping)}

If the function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is such that each element in the \(B\) (codomain) has at least one pre-image in \(A\), then we say that the function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is an onto function.
f: A \(\rightarrow B\) is surjective iff \(\forall b \in B\), there exists some \(a \in A\) such that \(f(a)=b\)

\section*{Note:}
- If the range of \(f=\) codomain of \(f\), then the function f is onto function

- If codomain of a function is not given then it is taken as \(\mathbb{R}\).

\section*{Examples:}

Let us consider a function, \(\mathrm{f}: \mathbb{R} \rightarrow[-1,1]\), \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}\).
Here, Range = Codomain
\(\Rightarrow\) Function \(\mathrm{f}(\mathrm{x})\) is onto

Let us consider another function,
\(\mathrm{f}: \mathbb{R} \rightarrow[-1,2], \mathrm{f}(\mathrm{x})=\cos \mathrm{x}\);
We know that the range of \(f(x)\) is \([-1,1]\)
Here,
Range \(\subset\) Codomain
\(\Rightarrow\) Function \(\mathrm{f}(\mathrm{x})\) is not onto

\section*{Into function}

If the function \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is such that there exists at least one element in B (codomain), which has no preimage in the set A , then \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) is called an into function.

\section*{Note:}
- If the range of \(f \neq\) codomain of \(f\), then the function \(f\) is into function
- If a function is onto, it cannot be into and vice versa.

\section*{Examples:}
(i) Let \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}\) such that \(\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}+\mathrm{x}-2\)
\(\Rightarrow f(x)=(x+2)(x-1)\)
Here \(f(x)\) is a quadratic whose minimum point on the curve is \(\left(-\frac{\mathrm{b}}{2 \mathrm{a}},-\frac{\mathrm{D}}{4 \mathrm{a}}\right) \equiv\left(-\frac{1}{2},-\frac{9}{4}\right)\)
Hence, the range of the function \(f(x)\) is \(\left[-\frac{9}{4}, \infty\right)\)
But given, Codomain \(=\mathbb{R}\)
\(\Rightarrow\) Range \(\neq\) Codomain
\(\Rightarrow\) The function is an into function
(ii) \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}, \mathrm{f}(\mathrm{x})=[\mathrm{x}]\)

Range \(=\mathbb{Z} \subset \mathbb{R}\)
\(\Rightarrow \mathrm{f}(\mathrm{x})\) is an into function
(iv) \(f: \mathbb{R} \rightarrow \mathbb{R}, f(x)=\operatorname{sgn}(x)\)

Range \(=\{-1,0,1\} \subset \mathbb{R}\)
\(\Rightarrow \mathrm{f}(\mathrm{x})\) is an into function

(iii) \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}, \mathrm{f}(\mathrm{x})=\{\mathrm{x}\}\)

Range \(=[0,1) \subset \mathbb{R}\)
\(\Rightarrow f(x)\) is an into function
(v) \(f: \mathbb{R} \rightarrow\{-1,0,1\}, f(x)=\operatorname{sgn}(x)\)

> Range \(=\{-1,0,1\}=\) Codomain \(\Rightarrow f(x)\) is an onto function
- When a function is both one-one and onto, then the function is known as a bijective function.
- A function can be of one of the following four types:
(i) One-one, onto (injective and surjective); also known as bijective functions
(ii) One-one, into (injective but not surjective)
(iii) Many-one, onto (surjective but not injective)
(iv) Many-one, into (neither surjective nor injective)

If the function \(\mathrm{f}: \mathbb{R}-\{-1,1\} \rightarrow A\), defined by \(f(x)=\frac{x^{2}}{1-x^{2}}\) is surjective, then what is \(A\) equal to?
(a) \(\mathbb{R}-[-1,0)\)
(b) \(\mathbb{R}-\{-1\}\)
(c) \(\mathbb{R}-(-1,0)\)
(d) \([0, \infty)\)
JEE MAIN 2019

\section*{Solution}

\section*{Step 1:}

Let \(f(x)=y=\frac{x^{2}}{1-x^{2}}\)
\(\Rightarrow x^{2}=y-y x^{2}\)
\(\Rightarrow x^{2}(1+y)=y\)
\(\Rightarrow x^{2}=\frac{y}{(1+y)}\)
\(\Rightarrow x^{2}=\frac{y(1+y)}{(1+y)^{2}}\)
\(\Rightarrow y(y+1) \geq 0 ; y \neq-1\)

\section*{Step 2:}

By using the wavy curve method, we get, \(y \in(-\infty,-1) \cup[0, \infty)\)

\(\Rightarrow y \in \mathbb{R}-[-1,0)\)
As the given function is surjective,
\(\Rightarrow\) Range of \(\mathrm{f}=\) Codomain of f
\(\Rightarrow A \in \mathbb{R}-[-1,0)\)
Option (a) is the correct answer.
\[
\begin{aligned}
& f(x)=\sin \left(\frac{\pi x}{2}\right):[-1,1] \rightarrow[-1,1] \text { is } \\
& \begin{array}{lll}
\text { (a) One-one, onto } & \text { (b) Many-one, onto } & \text { (c) One-one, into }
\end{array} \text { (d) Many-one, into }
\end{aligned}
\]

\section*{Solution}

The function \(\mathrm{f}(\mathrm{x})=\sin \left(\frac{\pi \mathrm{x}}{2}\right)\) can be plotted as
shown in the diagram.
From the diagram, we can see
Range of the function \(=[-1,1]\)
Hence, Range = Codomain
\(\Rightarrow\) The function is onto
By the horizontal line test, \(\mathrm{f}(\mathrm{x})\) is one-one
\(\Rightarrow\) The given function \(f(x)\) is one-one and onto
\(\therefore\) Option (a) is the correct answer

\section*{Principle of inclusion and exclusion}
- Let us consider two sets, \(A\) and \(B\).

\(n(A \cup B)=n(A)+n(B)-n(A \cap B)\)
As \(n(A \cap B)\) is included in both \(n(A)\) and \(n(B)\), it is excluded once to get \(n(A \cup B)\)
Let \(n(A)+n(B)=S_{1}\)
And \(n(A \cap B)=S_{2}\)
Then, \(n(A \cup B)=S_{1}-S_{2}\)
Similarly, for the three sets: A, B, and C.

\(n(A \cup B \cup C)=n(A)+n(B)+n(C)-n(A \cap B)-n(A \cap C)-n(B \cap C)+n(A \cap B \cap C)\)
\(\Rightarrow \mathrm{n}(\mathrm{A} \cup \mathrm{B} \cup \mathrm{C})=\mathrm{S}_{1}-\mathrm{S}_{2}+\mathrm{S}_{3}\)
The obtained result can be generalised as follows:
\(n\left(A_{1} \cup A_{2} \cup \ldots \cup A_{n}\right)=S_{1}-S_{2}+S_{3}-\ldots+(-1)^{n+1} S_{n}\)

\section*{Number of onto functions}

Let the function be \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\),
Where \(n(A)=m\) and \(n(B)=n\)
Case 1: When \(m>n\)
- \(n\left(A_{i}\right)=\) Total number of functions when \(y_{i}\) (from set \(B\) ) is excluded \(={ }^{n} C_{1}(n-1)^{m}\)
- \(n\left(A_{i} \cap A_{i}\right)=\) Total number of functions when \(y_{i}\) and \(y_{j}\) are excluded \(={ }^{n} C_{2}(n-2)^{m}\)
- Total number of functions where at least one element is excluded
\[
\begin{aligned}
& =n\left(A_{1} \cup A_{2} \cup A_{3} \cup \ldots . \cup A_{n}\right) \\
& =\sum_{n}\left(A_{i}\right)-\sum n\left(A_{i} \cap A_{j}\right)+\sum n\left(A_{i} \cap A_{j} \cap A_{k}\right)-\ldots \\
& ={ }^{n} C_{1}(n-1)^{m}-{ }^{n} C_{2}(n-2)^{m}+\ldots
\end{aligned}
\]

Number of onto functions \(=n^{m}-n\left(A_{1} \cup A_{2} \cup A_{3} \cup \ldots . . \cup A_{n}\right)\)
\[
=n^{m}-\left({ }^{n} C_{1}(n-1)^{m}-{ }^{n} C_{2}(n-2)^{m}+. .\right)
\]

Case 2: When \(\mathrm{m}=\mathrm{n}\), number of onto functions \(=\mathrm{n}\) !
Case 3: When \(\mathrm{n}>\mathrm{m}\), no onto functions exist.

Number of onto functions \(-\left[\begin{array}{l}0,(m<n) \\ n!,(m=n) \\ n^{m}-\left({ }^{n} C_{1}(n-1)^{m}-{ }^{n} C_{2}(n-2)^{m}+. .\right),(m>n)\end{array}\right.\)

\section*{Note}

Number of into functions \(=(\) Total number of functions) \(-(\) Number of onto functions).
?3 Find the number of ways of distributing 5 balls into three distinct boxes considering the following conditions:
(a) Any number of balls can go to any number of boxes
(b) Each box has at least one ball

\section*{Solution}

5 balls represent set A.
3 boxes represent set B.
Mapping has to happen from A to B for the given conditions.
(a) Since each ball has 3 choices,

Number of ways = Total number of functions \(=3^{5}\)
(b) Here, we want the number of onto functions as none of the boxes is empty in this case.

Therefore, Total number of onto functions \(=3^{5}-\left[{ }^{3} \mathrm{C}_{1}(2)^{5}-{ }^{3} \mathrm{C}_{2}(1)^{5}\right]=150\)

Which of the following defines the function \(\mathrm{f}: \mathrm{R} \rightarrow\left[-\frac{1}{2}, \frac{1}{2}\right]\) as \(\mathrm{f}(\mathrm{x})=\frac{\mathrm{x}}{1+\mathrm{x}^{2}}\) ?
(a) Both injective and surjective
(b) Injective but not surjective
(c) Surjective but not injective
(d) Neither injective nor surjective

\section*{Solution}

\section*{Step 1:}
\(\mathrm{f}(\mathrm{x})=\mathrm{f}(\mathrm{y})\)
\(\Rightarrow \frac{x}{1+x^{2}}=\frac{y}{1+y^{2}}\)
\(\Rightarrow x+x y^{2}=y+y x^{2}\)
\(\Rightarrow \mathrm{x}-\mathrm{y}+\mathrm{xy}^{2}-\mathrm{yx}^{2}=0\)
\(\Rightarrow(x-y)+x y(y-x)=0\)
\(\Rightarrow(x-y)(1-x y)=0\)
\(\Rightarrow x=y ; x y \neq 1\)
\(\Rightarrow \mathrm{f}(\mathrm{x})\) is a one-one (injective) function.

\section*{Step 2:}
\[
\text { Let } f(x)=y=\frac{x}{1+x^{2}}
\]
\[
\Rightarrow x=y+y x^{2}
\]
\[
\Rightarrow x^{2} y-x+y=0
\]

For \(x \in \mathbb{R}\),
D \(\geq 0\)
\(\Rightarrow 1-4 y^{2} \geq 0\)
\(\Rightarrow(2 y-1)(2 y+1) \leq 0\)
\(\Rightarrow \mathrm{y} \in\left[-\frac{1}{2}, \frac{1}{2}\right] \quad\) (By wavy curve method)
Hence, Range = Codomain
\(f(x)\) is an onto (surjective) function.
\(\therefore\) Option (a) is the correct answer.

\section*{Concept Check}
1. If \(\mathrm{f}: \mathbb{R} \rightarrow[\mathrm{a}, \mathrm{b}], \mathrm{f}(\mathrm{x})=2 \sin \mathrm{x}-2 \sqrt{3} \cos \mathrm{x}+1\) is onto, then find the value of \(\mathrm{b}-\mathrm{a}\).
2. If \(f: \mathbb{R} \rightarrow \mathbb{R}, f(x)=x|x|\), then \(f(x)\) is
(a) One-one, onto
(b) Many-one, onto
(c) One-one, into
(d) Many-one, into
3. Let \(A=\{x \in \mathbb{R} ; x\) is not a positive integer \(\}\). Define a function \(f: A \rightarrow \mathbb{R}\) as \(f(x)=\frac{2 x}{x-1}\), then which of the following represents \(f\) ?
(a) Not injective
(b) Injective but not surjective
(c) Surjective but not injective
(d) Neither injective nor surjective

\section*{Summary Sheet}

\section*{Key Takeaways}
- Function \(f: A \rightarrow B\) is known as an onto function iff \(\forall b \in B\), there exists some \(a \in A\) such that \(f(a)=b\).
- A function that is both one-one and onto is known as a bijective function.
- If the function is \(f: A \rightarrow B\), where \(n(A)=m\) and \(n(B)=n\), then

Case 1: When \(m>n\),
\[
\text { Number of onto functions }=n^{m}-\left({ }^{n} C_{1}(n-1)^{m}-{ }^{n} C_{2}(n-2)^{m}+. .\right)
\]

Case 2: When m = n,
Number of onto functions \(=n\) !
Case 3: When \(\mathrm{n}>\mathrm{m}\),
No onto functions exist.
- Number of into functions = Total number of functions - Number of onto functions

\section*{Mind Map}

\section*{Classification}

Priciples of exclusion and inclusion

Number of onto functions

\section*{Self-Assessment}

Determine whether the following functions are into or onto functions.
(a) \(f(x)=|x|\), where \(x \in \mathbb{R}^{+}\)
(b) \(f(x)=c\), where c is a constant real number

\section*{Concept Check}
1.
\(f(x)=2 \sin x-2 \sqrt{3} \cos x+1\)
We know, \(\alpha \cos \theta+\beta \sin \theta \in\left[-\sqrt{\alpha^{2}+\beta^{2}}, \sqrt{\alpha^{2}+\beta^{2}}\right]\)
\(\Rightarrow 2 \sin x-2 \sqrt{3} \cos x \in\left[-\sqrt{2^{2}+(2 \sqrt{3})^{2}}, \sqrt{2^{2}+(2 \sqrt{3})^{2}}\right]\)
\(\Rightarrow 2 \sin x-2 \sqrt{3} \cos x \in[-4,4]\)
\(2 \sin x-2 \sqrt{3} \cos x+1 \in[-4+1,4+1]\)
\(\Rightarrow \mathrm{f}(\mathrm{x}) \in[-3,5]\)
As the given function is onto, we get,
\(\Rightarrow[\mathrm{a}, \mathrm{b}]=[-3,5]\)
\(\Rightarrow \mathrm{b}-\mathrm{a}=5-(-3)=8\)
2.
\(f(x)=x|x|-\left[\begin{array}{l}-x^{2}, x \leq 0 \Rightarrow f(x) \in(-\infty, 0] \\ x^{2}, x>0 \Rightarrow f(x) \in(0, \infty)\end{array}\right.\)
The given function can be plotted as shown in the figure.
The range of the function is \(\mathbb{R}\).
Here,
Range = Codomain
\(\Rightarrow\) The given function is an onto function.
By horizontal line test, \(\mathrm{f}(\mathrm{x})\) is a one-one function.
\(\Rightarrow\) The given function \(\mathrm{f}(\mathrm{x})\) is one-one and onto.
\(\therefore\) Option (a) is the correct answer.

\section*{3.}

\section*{Step 1:}
\(\mathrm{f}(\mathrm{x})=\mathrm{f}(\mathrm{y})\)
\(\Rightarrow \frac{2 x}{x-1}=\frac{2 y}{y-1}\)
\(\Rightarrow \mathrm{xy}-\mathrm{x}=\mathrm{xy}-\mathrm{y}\)
\(\Rightarrow \mathrm{x}=\mathrm{y}\)
\(\Rightarrow\) The function \(\mathrm{f}(\mathrm{x})\) is one-one (injective).

\section*{Step 2:}

Let \(\mathrm{f}(\mathrm{x})=\mathrm{y}=\frac{2 \mathrm{x}}{\mathrm{x}-1}\)
\(\Rightarrow 2 \mathrm{x}=\mathrm{xy}-\mathrm{y}\)
\(\Rightarrow \mathrm{y}=\mathrm{x}(\mathrm{y}-2)\)
\(\Rightarrow x=\frac{y}{y-2}\)
\(\Rightarrow x=\frac{y(y-2)}{(y-2)^{2}}\)
\(\Rightarrow y(y-2) \leq 0 \quad(\because x \leq 0)\)
(y cannot be 2 as \(\mathrm{y}-2\) is in denominator)
\(\Rightarrow \mathrm{y} \in[0,2\) ) (By wavy curve method)
Here,
Range \(\neq\) Codomain
The function \(f(x)\) is not onto (surjective).
\(\therefore\) Option (b) is the correct answer.

\section*{Self-Assessment}
(a) \(f(x)=|x|\), where \(x \in \mathbb{R}^{+}\)

For \(\mathrm{x} \in \mathbb{R}^{+}, \mathrm{f}(\mathrm{x})=\mathrm{x}\)

For the domain, \(x \in \mathbb{R}^{+}\), the range of the function is \(\mathrm{y} \in \mathbb{R}^{+}\).
As the co-domain is not given, it is taken as \(\mathbb{R}\). Since the range and the co-domain of the given function are not equal, the given function is an into function.
(b) \(f(x)=c\), where \(c\) is a constant real number

The range of the function is \(\{c\}\), while the codomain is \(\mathbb{R}\). Therefore, the given function is an into function.

\title{
RELATIONS AND FUNCTIONS \\ ODD AND EVEN FUNCTIONS
}

\section*{What you already know}
- One-one and many-one functions
- Onto functions and into functions
- Methods to identify one-one and many-one functions

\section*{What you will learn}
- Even and odd functions
- Composite function
- Properties of even and odd functions

\section*{Even Function}

If \(\mathrm{f}(-\mathrm{x})=\mathrm{f}(\mathrm{x}) \forall \mathrm{x}\) in the domain of f , then f is said to be an even function.
Some examples of even functions are, \(\mathrm{f}(\mathrm{x})=\cos \mathrm{x}, \mathrm{g}(\mathrm{x})=|\mathrm{x}|\), and \(\mathrm{h}(\mathrm{x})=\mathrm{x}^{2}+3\)
The graph of every even function is symmetric about the Y-axis.

In both the cases graph is symmetric about the Y-axis.

Identify whether function \(f(x)=\frac{x}{e^{x}-1}+\frac{x}{2}+1\) is even or not.

\section*{Solution}

\section*{Step 1}

Given, \(f(x)=\frac{x}{e^{x}-1}+\frac{x}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{-\mathrm{x}}{\mathrm{e}^{-\mathrm{x}}-1}+\frac{-\mathrm{x}}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{-\mathrm{x}}{\frac{1-\mathrm{e}^{\mathrm{x}}}{\mathrm{e}^{\mathrm{x}}}}-\frac{\mathrm{x}}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{-\mathrm{xe}^{\mathrm{x}}}{1-\mathrm{e}^{\mathrm{x}}}-\frac{\mathrm{x}}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{-\mathrm{xe}^{\mathrm{x}}+\mathrm{x}-\mathrm{x}}{1-\mathrm{e}^{\mathrm{x}}}-\frac{\mathrm{x}}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{\mathrm{x}\left(\mathrm{e}^{\mathrm{x}}-1\right)+\mathrm{x}}{\mathrm{e}^{\mathrm{x}}-1}-\frac{\mathrm{x}}{2}+1\)

\section*{Step 2}
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{\mathrm{x}}{\mathrm{e}^{\mathrm{x}}-1}+\mathrm{x}-\frac{\mathrm{x}}{2}+1\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\frac{\mathrm{x}}{\mathrm{e}^{\mathrm{x}}-1}+\frac{\mathrm{x}}{2}+1=\mathrm{f}(\mathrm{x})\)
Hence, function \(f(x)\) is an even function.

\section*{Odd Function}

If \(f(-x)=-f(x) \forall x\) in the domain of \(f\), then \(f\) is said to be an odd function.
Some examples of odd functions are, \(\mathrm{f}(\mathrm{x})=\mathrm{x}, \mathrm{g}(\mathrm{x})=\sin \mathrm{x}\) and \(\mathrm{h}(\mathrm{x})=\tan \mathrm{x}\)
The graph of an odd function is symmetric about the origin.

\section*{Example}

In both the cases, the graph is symmetric about the origin.

\section*{Note}
- For an odd function, \(\mathrm{f}(-\mathrm{x})=-\mathrm{f}(\mathrm{x}) \forall \mathrm{x}\) in the domain of f .

Now, substituting \(x=0\), we get
\(f(0)=-f(0)\)
\(\Rightarrow \mathrm{f}(0)=0\)
If an odd function is defined at \(\mathrm{x}=0\), then \(\mathrm{f}(0)=0\)
- Some functions may neither be even nor odd (NENO)

For example, \(\mathrm{f}(\mathrm{x})=3 \mathrm{x}+2\)
\(f(-x)=-3 x+2\)
Clearly, for \(\mathrm{f}(\mathrm{x})\), neither \(\mathrm{f}(-\mathrm{x})=\mathrm{f}(\mathrm{x})\) nor \(\mathrm{f}(-\mathrm{x})=-\mathrm{f}(\mathrm{x})\)
Therefore, \(\mathrm{f}(\mathrm{x})\) is neither even nor odd.

\section*{Properties of Even and Odd Functions}
- The only function that is defined on the entire number line and is even as well as odd is \(f(x)=0\)

For function \(\mathrm{f}(\mathrm{x})=0\),
\(\mathrm{f}(-\mathrm{x})=\mathrm{f}(\mathrm{x})=0 \Rightarrow\) Even function
\(f(-x)=-f(x)=0 \Rightarrow\) Odd function

- All functions (whose domain is symmetric about origin) can be expressed as the sum of an even and an odd function.
\[
\mathrm{f}(\mathrm{x})=\underbrace{\frac{\mathrm{f}(\mathrm{x})+\mathrm{f}(-\mathrm{x})}{2}}_{\text {Even }}+\frac{\mathrm{f}(\mathrm{x})-\mathrm{f}(-\mathrm{x})}{2} \underbrace{2}_{\text {Odd }}
\]

Proof
Let's consider
\(h(x)=\frac{f(x)+f(-x)}{2}\) and \(g(x)=\frac{f(x)-f(-x)}{2}\)
Now, \(h(-x)=\frac{f(-x)+f(x)}{2}\) and \(g(-x)=\frac{f(-x)-f(x)}{2}\)
\(\Rightarrow \mathrm{h}(-\mathrm{x})=\mathrm{h}(\mathrm{x})\) and \(\mathrm{g}(-\mathrm{x})=-\mathrm{g}(\mathrm{x})\)
Hence, function \(h(x)\) is even and \(g(x)\) is odd.

Express function \(f(x)=x+e^{x}\) as the sum of an even and an odd function.

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})=\mathrm{x}+\mathrm{e}^{\mathrm{x}}\)
As we know that,
\(f(x)=\frac{f(x)+f(-x)}{2}+\underbrace{\frac{f(x)-f(-x)}{2}}_{\text {Odd }}\)
\(f(x)=\frac{\left(x+e^{x}\right)+\left(-x+e^{-x}\right)}{2}+\frac{\left(x+e^{x}\right)-\left(-x+e^{-x}\right)}{2}\)
\(\Rightarrow f(x)=\frac{e^{x}+e^{-x}}{2}+\frac{\left(2 x+e^{x}-e^{-x}\right)}{2}\)

Let \(f(x)=a^{x} ;(a>0)\) be written as \(f(x)=f_{1}(x)+f_{2}(x)\), where \(f_{1}(x)\) is an even function and \(f_{2}(x)\) is an odd function, then find the value of \(f_{1}(x+y)+f_{1}(x-y)\).
(a) \(2 f_{1}(x+y) f_{1}(x-y)\)
(b) \(2 \mathrm{f}_{1}(\mathrm{x}) \mathrm{f}_{1}(\mathrm{y})\)
(c) \(2 f_{1}(x) f_{2}(y)\)
(d) \(2 f_{1}(x+y) f_{2}(x-y)\)

\section*{Solution}

Given, \(f(x)=a^{x} ;(a>0)\) and \(f(x)=f_{1}(x)+f_{2}(x)\), where \(f_{1}(x)\) is an even function and \(f_{2}(x)\), is an odd function.
\[
\begin{aligned}
& \Rightarrow f_{1}(x)=\frac{f(x)+f(-x)}{2}=\frac{a^{x}+a^{-x}}{2} \\
& \Rightarrow \begin{aligned}
\Rightarrow f_{1}(x+y)+f_{1}(x-y) & =\frac{a^{(x+y)}+a^{-(x+y)}}{2}+\frac{a^{(x-y)}+a^{-(x-y)}}{2} \\
\Rightarrow f_{1}(x+y)+f_{1}(x-y) & =\frac{a^{x} a^{y}+a^{-x} a^{-y}+a^{x} a^{-y}+a^{-x} a^{y}}{2} \\
& =\frac{a^{x}\left(a^{y}+a^{-y}\right)+a^{-x}\left(a^{y}+a^{-y}\right)}{2} \\
& =\frac{\left(a^{x}+a^{-x}\right)\left(a^{y}+a^{-y}\right)}{2}
\end{aligned}
\end{aligned}
\]
\(\Rightarrow f_{1}(x+y)+f_{1}(x-y)=2 f_{1}(x) f_{1}(y)\)
Hence, option (b) is the correct answer.
- If \(f(x)=x^{2}=\) Even and \(g(x)=|x|=\) Even, then,
\(\mathrm{f} \pm \mathrm{g}=\mathrm{x}^{2} \pm|\mathrm{x}|=\) Even
f.g \(=x^{2} \times|x|=\) Even
\(\frac{f}{g}=\frac{x^{2}}{|x|}=\) Even \(x \neq 0\)
\begin{tabular}{|c|c|c|c|c|}
\hline f & g & \(\mathrm{f} \pm \mathrm{g}\) & \(\mathrm{f} \times \mathrm{g}\) & \(\frac{\mathrm{f}}{\mathrm{g}}, \mathrm{g} \neq 0\) \\
\hline Even & Even & Even & Even & Even \\
\hline
\end{tabular}
- If \(\mathrm{f}(\mathrm{x})=\mathrm{x}=\) Odd and \(\mathrm{g}(\mathrm{x})=\sin \mathrm{x}=\) Odd, then,
\begin{tabular}{|c|c|c|c|c|}
\hline f & g & \(\mathrm{f} \pm \mathrm{g}\) & \(\mathrm{f} \times \mathrm{g}\) & \(\frac{\mathrm{f}}{\mathrm{g}}, \mathrm{g} \neq 0\) \\
\hline Odd & Odd & Odd & Even & Even \\
\hline
\end{tabular}
- If \(f(x)=x^{2}=\) Even and \(g(x)=x=\) Odd, then,
\begin{tabular}{|c|c|c|c|c|}
\hline f & g & \(\mathrm{f} \pm \mathrm{g}\) & \(\mathrm{f} \times \mathrm{g}\) & \(\frac{\mathrm{f}}{\mathrm{g}}, \mathrm{g} \neq 0\) \\
\hline Even & Odd & NENO & Odd & Odd \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|c|}
\hline f & g & \(\mathrm{f} \pm \mathrm{g}\) & \(\mathrm{f} . \mathrm{g}\) & \(\frac{\mathrm{f}}{\mathrm{g}}, \mathrm{g} \neq 0\) \\
\hline Even & Even & Even & Even & Even \\
\hline Odd & Odd & Odd & Even & Even \\
\hline Even & Odd & NENO & Odd & Odd \\
\hline
\end{tabular}

Find whether the following functions are even, odd, or none.
(a) \(f(x)=x \times \tan x+\cos ^{2} x\)
(b) \(f(x)=\ln \left(\frac{1+x}{1-x}\right),|x|<1\)

\section*{Solution}
(a) Given,
\(f(x)=x \times \tan x+\cos ^{2} x\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=-\mathrm{x} \times \tan (-\mathrm{x})+\cos ^{2}(-\mathrm{x})\) \(=\mathrm{x} \times \tan \mathrm{x}+\cos ^{2} \mathrm{x}\)
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\mathrm{f}(\mathrm{x})=\) Even function
(b) Given,
\[
\begin{aligned}
& \mathrm{f}(\mathrm{x})=\ln \left(\frac{1+\mathrm{x}}{1-\mathrm{x}}\right),|\mathrm{x}|<1 \\
& \begin{aligned}
& \Rightarrow \mathrm{f}(-\mathrm{x})=\ln \left(\frac{1-\mathrm{x}}{1+\mathrm{x}}\right) \\
& \quad=-\ln \left(\frac{1+\mathrm{x}}{1-\mathrm{x}}\right)
\end{aligned} \\
& \Rightarrow \mathrm{f}(-\mathrm{x})=-\mathrm{f}(\mathrm{x})=\text { Odd function }
\end{aligned}
\]

\section*{Composite Function}

The composition of a function is an operation where two functions, say \(f\) and \(g\), generate a new function, say \(h\), in such a way that \(h(x)=g(f(x))\). In this operation, the function \(g\) is applied to the result of applying the function \(f\) to \(x\).
Let us consider functions f: \(\mathrm{X} \rightarrow \mathrm{Y}_{1}\) and \(\mathrm{g}: \mathrm{Y}_{2} \rightarrow \mathrm{Z}\)

Here, \(g(f(a))=g(3)=\beta\)

Here, \(g(f(b))=g(9)=\delta\)

Here, \(g(f(c))=g(1)=\) Not defined

Here, \(\mathrm{g}(\mathrm{f}(\mathrm{d}))=\mathrm{g}(5)=\) Not defined

So, \(g(f(x))\) is defined for only those values of \(x\) for which the range of \(f\) is a subset of the domain of \(g\).
\(\therefore \mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}_{1}\) and \(\mathrm{g}: \mathrm{Y}_{2} \rightarrow \mathrm{Z}\) are two functions and D is set of x such that if \(\mathrm{x} \in \mathrm{X}\), then \(\mathrm{f}(\mathrm{x}) \in \mathrm{Y}_{2}\) If domain, \(\mathrm{D} \neq \varphi\), then function \(h\) defined by \(h(x)=g(f(x))\) is known as the composite function of \(g\) and \(f\). A composite function is denoted by \(\operatorname{gof}(x)\) or \(g(f(x))\). It is also known as a function of a function.
Pictorially, gof(x) can be viewed as follows:

\section*{Note}

The domain of \(\operatorname{gof}(x)\) is \(D\) which is a subset of \(X\) (the domain of \(f\) ). The range of \(g o f(x)\) is a subset of the range of \(g\). If \(D=X\), then \(f(x) \subseteq Y_{2}\)

\section*{If two functions \(f\) and \(g\) are defined from \(\mathbb{R} \rightarrow \mathbb{R}\) such that \(f(x)=x+1\) and \(g(x)=x+2\),} then, find the values of \(g(f(x)), f(g(x))\).

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})=\mathrm{x}+1, \mathrm{~g}(\mathrm{x})=\mathrm{x}+2\) and f and g are defined from \(\mathbb{R} \rightarrow \mathbb{R}\)
\(g(f(x))=f(x)+2\)
\(=x+1+2=x+3\)
\(\Rightarrow \mathrm{g}(\mathrm{f}(\mathrm{x}))=\mathrm{x}+3\)
\(f(g(x))=g(x)+1\)
\[
=x+2+1=x+3
\]
\(\Rightarrow \mathrm{f}(\mathrm{g}(\mathrm{x}))=\mathrm{x}+3\)
Here, \(\mathrm{g}(\mathrm{f}(\mathrm{x}))=\mathrm{f}(\mathrm{g}(\mathrm{x}))\)

\section*{Note}

In general, \(g(f(x)) \neq f(g(x))\)
\[
\text { If } \mathrm{f}(\mathrm{x})=\log _{\mathrm{e}}\left(\frac{1-\mathrm{x}}{1+\mathrm{x}}\right),|\mathrm{x}|<1 \text {, then find } \mathrm{f}\left(\frac{2 \mathrm{x}}{1+\mathrm{x}^{2}}\right) \text {. }
\]
(a) \(2 f(x)\)
(b) \([\mathrm{f}(\mathrm{x})]^{2}\)
(c) \(2 \mathrm{f}\left(\mathrm{x}^{2}\right)\)
(d) \(-2 \mathrm{f}(\mathrm{x})\)

Given, \(f(x)=\log _{e}\left(\frac{1-x}{1+x}\right),|x|<1\)
Let us consider \(\mathrm{g}(\mathrm{x})=\frac{2 \mathrm{x}}{1+\mathrm{x}^{2}}\), then,
\[
\begin{aligned}
& f\left(\frac{2 x}{1+x^{2}}\right)=f(g(x))=\ln \left(\frac{1-g(x)}{1+g(x)}\right) \\
& \Rightarrow f(g(x))=\ln \left(\frac{1-\frac{2 x}{1+x^{2}}}{1+\frac{2 x}{1+x^{2}}}\right)=\ln \left(\frac{1+x^{2}-2 x}{1+x^{2}+2 x}\right)=\ln \left(\frac{1-x}{1+x}\right)^{2} \\
& \Rightarrow f(g(x))=2 \ln \left(\frac{1-x}{1+x}\right)=2 f(x)
\end{aligned}
\]

\section*{Hence, option (a) is the correct answer.}

\section*{Properties of Composite functions}

\section*{Associative property of composite functions}

Composite functions are associative, i.e., if three functions \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}, \mathrm{g}: \mathrm{B} \rightarrow \mathrm{C}\) and \(\mathrm{h}: \mathrm{C} \rightarrow \mathrm{D}\) are such that fo(goh) and (fog)oh are defined, then fo(goh) \(=\) (fog) oh

\section*{Example}

If \(f(x)=x, g(x)=\sin x, h(x)=e^{x}\), the domain of \(f, g, h\) is \(\mathbb{R}\). Prove that fo \((g o h)=(f o g)\) oh

\section*{Solution}

As the domain of the three given functions \(\mathrm{f}, \mathrm{g}\), h is a real number, the composite functions fo(goh) and (fog)oh are defined.
\(\mathrm{fo}(\mathrm{goh})=\mathrm{fo}\left(\mathrm{g}(\mathrm{h}(\mathrm{x}))=\mathrm{fo}\left(\mathrm{g}\left(\mathrm{e}^{\mathrm{x}}\right)\right)\right.\)
\(\Rightarrow \mathrm{fo}(\mathrm{goh})=\mathrm{f}\left(\sin \mathrm{e}^{\mathrm{x}}\right)=\sin \mathrm{e}^{\mathrm{x}}\)
\((f \circ g)\) oh \(=(f f o g)(h(x))\) and \((f o g)(x)=f(g(x))=f(\sin x)=\sin x\)
\(\Rightarrow(f o g)(h(x))=\sin (h(x))=\sin e^{x}\)
Therefore, fo(goh) \(=(f o g)\) oh

\section*{For \(f(x)=\sqrt{x+3}, g(x)=1+x^{2}\), find the domain and range of \(g o f(x)\).}

\section*{Solution}

\section*{Step 1}

Domain of \(f(x):[-3, \infty)\)
Range of \(f(x):[0, \infty)\)
Domain of \(g(x): \mathbb{R}\)
Range of \(g(x):[1, \infty)\)

\section*{Step 3}
\(\operatorname{gof}(\mathrm{x})=\mathrm{g}(\mathrm{f}(\mathrm{x}))=1+(\mathrm{f}(\mathrm{x}))^{2}=1+\mathrm{x}+3=\mathrm{x}+4\)
The range of \(\operatorname{gof}(x)\) is \([1, \infty)\).

\section*{Step 2}

For \(\operatorname{gof}(x)\), since the range of \(f\) is a subset of domain of \(g\), the domain of \(\operatorname{gof}(x)\) is \([-3, \infty)\).
?
\[
f(x)=\left\{\begin{array}{l}
1-x, x \leq 0 \\
x^{2}, x>0
\end{array}\right.
\]
\[
g(x)=\left\{\begin{array}{l}
-x, x<1 \\
1-x, x \geq 1
\end{array}\right.
\]

\section*{Solution}

For \(\mathrm{f}(\mathrm{g}(\mathrm{x}))\) to be defined, \(\mathrm{R}_{\mathrm{g}} \subseteq \mathrm{D}_{\mathrm{f}}\)
As we can observe that the domain of the function \(f\) is a real number, i.e., \(D_{f}=\mathbb{R}\)
For the range of the function g , let us plot the graph of this linear function.
The range of function g is also a real number.
Therefore, the composite function \(\mathrm{f}(\mathrm{g}(\mathrm{x})\) ) is valid as range of \(g\) is domain of \(f\).
Replace x with \(\mathrm{g}(\mathrm{x})\) in the given definition of \(\mathrm{f}(\mathrm{x})\).

\(\Rightarrow \mathrm{f}(\mathrm{g}(\mathrm{x}))= \begin{cases}1-\mathrm{g}(\mathrm{x}), & \mathrm{g}(\mathrm{x}) \leq 0 \\ (\mathrm{~g}(\mathrm{x}))^{2}, & \mathrm{~g}(\mathrm{x})>0\end{cases}\)
Identify the portions of the function g , where \(\mathrm{g}(\mathrm{x})>0\) and \(\mathrm{g}(\mathrm{x}) \leq 0\) along with the corresponding values of x .

Therefore,
\(f(g(x))=\left\{\begin{array}{l}1-(-x), g(x) \leq 0,0 \leq x<1 \\ 1-(1-x), g(x) \leq 0, x \geq 1 \\ (-x)^{2}, g(x)>0, x<0\end{array}\right.\)
\(\Rightarrow f(g(x))=\left\{\begin{array}{l}1+x, 0 \leq x<1 \\ x, x \geq 1 \\ x^{2}, x<0\end{array}\right.\)

\section*{Concept Check}
1. Identify whether the function \(\mathrm{f}(\mathrm{x})=\ln \left(\mathrm{x}+\sqrt{1+\mathrm{x}^{2}}\right)\) is even or odd.
2. Find whether the function \(f(x)=10 x^{3}-4 x^{2}+3 x-8\) even/odd or none.
3. Two functions \(f\) and \(g\) are defined from \(\mathbb{R} \rightarrow \mathbb{R}\) such that \(f(x)=x^{2}, g(x)=x+1\). Find \(g(f(x))\) and \(\mathrm{f}(\mathrm{g}(\mathrm{x}))\).
4. If \(g(x)=x^{2}+x-1\) and \(g(f(x))=4 x^{2}-10 x+5\), then what is the value of \(f\left(\frac{5}{4}\right)\) ?
\(\begin{array}{llll}\text { (a) }-\frac{3}{2} & \text { (b) }-\frac{1}{2} & \text { (c) } \frac{1}{2} & \text { (d) } \frac{3}{2}\end{array}\)
(a) \(-\frac{3}{2}\)
(b) \(-\frac{1}{2}\)
(c) \(\frac{1}{2}\)
(d) \(\frac{3}{2}\)

JEE MAIN JAN 2020

\section*{Summary Sheet}

\section*{Key Takeaways}
- If \(f(-x)=f(x) \forall x\) in the domain of \(f\), then \(f\) is said to be an even function.
- If \(f(-x)=-f(x) \forall x\) in the domain of \(f\), then \(f\) is said to be an odd function.
- For an odd function, \(\mathrm{f}(-\mathrm{x})=-\mathrm{f}(\mathrm{x}) \forall \mathrm{x}\) in the domain of \(\mathrm{f}, \mathrm{f}(0)=0\)
- All the functions (whose domain is symmetric about origin) can be expressed as the sum of an even and an odd function.
\[
f(x)=\frac{f(x)+f(-x)}{2}+\underbrace{2}_{\text {Even }}
\]
- The composition of a function is an operation where two functions, say f and g , generate a new function, say \(h\), in such a way that \(h(x)=g(f(x))\). It means that function \(g\) is applied to the function of x . Basically, a function is applied to the result of another function.
- The domain of gof is \(D\) which is a subset of \(X\) (the domain of \(f\) ). The range of gof is a subset of the range of g . If \(\mathrm{D}=\mathrm{X}\), then \(\mathrm{f}(\mathrm{x}) \subseteq \mathrm{Y}_{2}\).
- Composite functions are associative, i.e., if three functions \(f: A \rightarrow B, g: B \rightarrow C\), and \(h: C \rightarrow D\) are such that fo(goh) and (fog)oh are defined, then fo(goh) \(=\) (fog)oh

\section*{Self-Assessment}

Find if the given functions in their respective domains are even, odd, or neno.
\(\mathrm{f}(\mathrm{x})=\sqrt{1+\mathrm{x}+\mathrm{x}^{2}}+\sqrt{1-\mathrm{x}+\mathrm{x}^{2}}\)

\section*{A}

\section*{Answers}

\section*{Concept Check}
1.
\(f(x)=\ln \left(x+\sqrt{1+x^{2}}\right)\)
\[
\begin{aligned}
\Rightarrow f(-x) & =\ln \left(-x+\sqrt{1+x^{2}}\right)=\ln \left(\frac{\left(-x+\sqrt{1+x^{2}}\right)\left(x+\sqrt{1+x^{2}}\right)}{\left(x+\sqrt{1+x^{2}}\right)}\right) \\
& =\ln \left(\frac{1}{\left(x+\sqrt{1+x^{2}}\right)}\right) \\
& =-\ln \left(x+\sqrt{1+x^{2}}\right)
\end{aligned}
\]

Hence, \(\mathrm{f}(\mathrm{x})\) is an odd function.
2.
\[
\begin{aligned}
& f(x)=10 x^{3}-4 x^{2}+3 x-8 \\
& \begin{aligned}
\Rightarrow f(-x) & =10(-x)^{3}-4(-x)^{2}+3(-x)-8 \\
& =-10 x^{3}-4 x^{2}-3 x-8 \\
= & -\left(10 x^{3}+4 x^{2}+3 x+8\right)
\end{aligned}
\end{aligned}
\]
\(f(x)\) is neither even nor odd.
3.

Given, \(f(x)=x^{2}, g(x)=x+1\) and \(f\) and \(g\) are defined from \(\mathbb{R} \rightarrow \mathbb{R}\)
\(\Rightarrow \mathrm{g}(\mathrm{f}(\mathrm{x}))=\mathrm{f}(\mathrm{x})+1\)
\[
=x^{2}+1
\]
\(\Rightarrow \mathrm{g}(\mathrm{f}(\mathrm{x}))=\mathrm{x}^{2}+1\)
\(\Rightarrow \mathrm{f}(\mathrm{g}(\mathrm{x}))=[\mathrm{g}(\mathrm{x})]^{2}\)
\[
=(x+1)^{2}=x^{2}+2 x+1
\]
\(\Rightarrow \mathrm{f}(\mathrm{g}(\mathrm{x}))=\mathrm{x}^{2}+2 \mathrm{x}+1\)
Here, \(\mathrm{g}(\mathrm{f}(\mathrm{x})) \neq \mathrm{f}(\mathrm{g}(\mathrm{x}))\)
4.

Given, \(g(x)=x^{2}+x-1\) and \(g(f(x))=4 x^{2}-10 x+5\)
By substituting \(x=\frac{5}{4}\) in \(g(f(x))\), we get,
\(\Rightarrow \mathrm{g}\left(\mathrm{f}\left(\frac{5}{4}\right)\right)=4\left(\frac{5}{4}\right)^{2}-10\left(\frac{5}{4}\right)+5=\frac{25}{4}-\frac{25}{2}+5\)
\(\Rightarrow \mathrm{g}\left(\mathrm{f}\left(\frac{5}{4}\right)\right)=-\frac{5}{4}\)
Let \(\mathrm{f}\left(\frac{5}{4}\right)=\mathrm{a}\)
\(\Rightarrow \mathrm{g}(\mathrm{a})=-\frac{5}{4}\)
As the definition of function \(g\) is known, the input a for which the output \(-\frac{5}{4}\) is generated, can be easily found.
Therefore, \(\mathrm{g}(\mathrm{a})=\mathrm{a}^{2}+\mathrm{a}-1=-\frac{5}{4}\)
\(\Rightarrow \mathrm{a}^{2}+\mathrm{a}-1+\frac{5}{4}=0\)
\(\Rightarrow \mathrm{a}^{2}+\mathrm{a}+\frac{1}{4}=0\)
\(\Rightarrow\left(a+\frac{1}{2}\right)^{2}=0\)
\[
\begin{aligned}
& \Rightarrow \mathrm{a}=-\frac{1}{2} \\
& \Rightarrow \mathrm{f}\left(\frac{5}{4}\right)=-\frac{1}{2}
\end{aligned}
\]

\section*{Self-Assessment}

Given, \(\mathrm{f}(\mathrm{x})=\sqrt{1+\mathrm{x}+\mathrm{x}^{2}}+\sqrt{1-\mathrm{x}+\mathrm{x}^{2}}\)
\[
\begin{aligned}
\Rightarrow \mathrm{f}(-\mathrm{x}) & =\sqrt{1-\mathrm{x}+(-\mathrm{x})^{2}}+\sqrt{1+\mathrm{x}+(-\mathrm{x})^{2}} \\
& =\sqrt{1-\mathrm{x}+\mathrm{x}^{2}}+\sqrt{1+\mathrm{x}+\mathrm{x}^{2}}=\sqrt{1+\mathrm{x}+\mathrm{x}^{2}}+\sqrt{1-\mathrm{x}+\mathrm{x}^{2}}
\end{aligned}
\]
\(\Rightarrow \mathrm{f}(-\mathrm{x})=\mathrm{f}(\mathrm{x})\)

\section*{Hence, function \(f(x)\) is an even function}

\title{
RELATIONS AND FUNCTIONS
}

\section*{PERIODIC FUNCTIONS}

\section*{What you already know}
- Types of functions
- Composite functions

\section*{What you will learn}
- Properties of composite functions
- Properties of periodic functions
- Periodic functions

\section*{Properties of a Composite Function}

\section*{Property 1}

If the functions \(f\) and \(g\) are one-one functions, then gof, if defined, will be a one-one function.
Example

Let the functions be \(f\) and \(g\) that are shown in the arrow diagram.
Function gof is defined because \(\mathrm{R}_{\mathrm{f}}\) and \(\mathrm{D}_{\mathrm{g}}\) have common elements.
\(R_{f}=\{1,3,5,9\}\) and \(D_{g}=\{0,3,9,13\}\)
\(\Rightarrow R_{f} \cap D_{g}=\{3,9\}\)

As we can observe that \(f\) and \(g\) are one-one functions, they result in a valid composite function gof, which is also a one-one function

\section*{Property 2}

If the functions \(f\) and \(g\) are bijective functions and gof is defined, then gof will be a bijection iff range of \(f\) is equal to the domain of \(g\).

\section*{Example}
\(\qquad\)

It is given that the two functions are bijections, i.e., functions \(f\) and \(g\), are both one-one and onto.
\(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\) and \(\mathrm{g}: \mathrm{B} \rightarrow \mathrm{C}\)

As \(R_{f}=D_{g}\), and thus, gof is defined.
The composite function gof: \(\mathrm{A} \rightarrow \mathrm{C}\) is as shown.
Therefore, gof : A \(\rightarrow \mathrm{C}\) is a bijection from its definition.

\section*{Property 3}

The composition of functions (which are either even or odd) is even if at least one of them is even.

\section*{Example}

Let \(\mathrm{f}(\mathrm{x})=\mathrm{x}, \mathrm{g}(\mathrm{x})=\sin \mathrm{x}, \mathrm{h}(\mathrm{x})=\cos \mathrm{x}\). Check whether \(\mathrm{f}(\mathrm{g}(\mathrm{h}(\mathrm{x})))\) is an even function or not?

\section*{Solution}

\section*{Step 1}
\(h(x)=\cos x\) is an even function.
\[
\begin{align*}
\mathrm{f}(\mathrm{~g}(\mathrm{~h}(\mathrm{x}))) & =\mathrm{f}(\mathrm{~g}(\cos \mathrm{x}))=\sin (\cos \mathrm{x}) \ldots \text { (i) } \\
\mathrm{f}(\mathrm{~g}(\mathrm{~h}(-\mathrm{x}))) & =\sin (\cos (-\mathrm{x})) \\
& =\sin (\cos \mathrm{x}) \ldots \text { (ii) } \tag{ii}
\end{align*}
\]

\section*{Step 2}

From (i) and (ii), we can say,
\(\mathrm{f}(\mathrm{g}(\mathrm{h}(\mathrm{x})) \mathrm{)}=\mathrm{f}(\mathrm{g}(\mathrm{h}(-\mathrm{x})))\)
So, \(\mathrm{f}(\mathrm{g}(\mathrm{h}(\mathrm{x})))\) is an even function. \((\because \mathrm{F}(\mathrm{x})=\mathrm{F}(-\mathrm{x}) \Rightarrow \mathrm{F}(\mathrm{x})\) is an even function \()\)
As \(\mathrm{h}(\mathrm{x})=\cos \mathrm{x}\) is an even function, composition \(\mathrm{f}(\mathrm{g}(\mathrm{h}(\mathrm{x})\) )) is an even function.

\section*{Periodic Functions}

A periodic function is a function that repeats its values after every particular interval.
Mathematically, a function \(f(x)\) is said to be a periodic function if there exists a positive real number T , such that \(\mathrm{f}(\mathrm{x}+\mathrm{T})=\mathrm{f}(\mathrm{x}), \forall \mathrm{x} \in \mathrm{D}_{\mathrm{f}} ; \mathrm{T}>0\)
Here, T is known as a period of function f and the smallest value of T is known as the fundamental period.

\section*{Note}

The domain of periodic function should not be restricted (bounded).

\section*{Examples of periodic function:}
1. \(f(x)=\sin x\)

We can observe that \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}\) repeats its value after every \(2 \pi\) interval.
Hence, \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}\) is a periodic function with a period of \(2 \pi\).
As the graph repeats for every \(2 \pi\) interval length, it will also repeat for \(4 \pi\) or \(6 \pi\) and so on.

\section*{Mathematical justification}

If the period of a function is \(T\), then \(f(x+a T)=f(x), a \in \mathbb{N}\)
Let \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}\) with a period T
\(\Rightarrow \sin (\mathrm{x}+\mathrm{T})=\sin \mathrm{x}\)
\(\Rightarrow \sin (\mathrm{x}+\mathrm{T})-\sin \mathrm{x}=0\)
\(\Rightarrow 2 \cos \left(\frac{2 \mathrm{x}+\mathrm{T}}{2}\right) \sin \left(\frac{\mathrm{T}}{2}\right)=0\)
\(\cos \left(\frac{2 x+T}{2}\right)=0\) is not considered because \(\cos \left(\frac{2 x+T}{2}\right)=\cos (2 n+1) \frac{\pi}{2}\) does not give the value of \(T\).
\(\Rightarrow \sin \left(\frac{\mathrm{T}}{2}\right)=0\) for \(\forall \mathrm{x} \in \mathbb{R}\)
\(\Rightarrow \frac{\mathrm{T}}{2}=\mathrm{n} \pi\)
\(\Rightarrow \mathrm{T}=2 \mathrm{n} \pi\)
\(\Rightarrow \sin (\mathrm{x}+2 \mathrm{n} \pi)=\sin \mathrm{x}\)
\(\Rightarrow \mathrm{f}(\mathrm{x}+2 \mathrm{n} \pi)=\mathrm{f}(\mathrm{x})\)
As T>0, the possible values of the period T are \(2 \pi, 4 \pi, 6 \pi\), and so on.
The smallest amongst these values is \(2 \pi\). This is known as the fundamental period of the function.
2. \(f(x)=\tan x\)

The function \(\tan \mathrm{x}\) is periodic with fundamental period as \(\pi\).
\(\Rightarrow \tan (x+\pi)=\tan x\)
\(\Rightarrow \tan (\mathrm{x}+\mathrm{a} \pi)=\tan \mathrm{x}, \mathrm{a} \in \mathbb{N}\)
Also, we can observe that the discontinuity of function \(\tan x\) also repeats for every \(\pi\) interval.

\section*{Note}

If a function is discontinuous and periodic with period \(T\), then its discontinuity also repeats after every T interval length.

\section*{Properties of Periodic Functions}

\section*{Property 1}

If a function \(\mathrm{f}(\mathrm{x})\) has period T , then \(\frac{1}{\mathrm{f}(\mathrm{x})},(\mathrm{f}(\mathrm{x}))^{\mathrm{n}}(\mathrm{n} \in \mathbb{N}),|\mathrm{f}(\mathrm{x})|, \sqrt{\mathrm{f}(\mathrm{x})}\) also have period T . (T may or
may not be a fundamental period.) (i) \(g(x)=\operatorname{cosec} x\)
\(\Rightarrow \mathrm{g}(\mathrm{x})=\frac{1}{\sin \mathrm{x}}, \mathrm{f}(\mathrm{x})=\sin \mathrm{x}\)
\(\Rightarrow \mathrm{g}(\mathrm{x})=\frac{1}{\mathrm{f}(\mathrm{x})}\)
The period of function \(\operatorname{cosec} x\) remains same as of the function \(\sin x\), which is \(2 \pi\). So, \(\operatorname{cosec} x\) has the fundamental period as \(2 \pi\).
Let us verify it using the graph of \(\mathrm{g}(\mathrm{x})=\operatorname{cosec} \mathrm{x}\)

We can observe that \(\mathrm{g}(\mathrm{x})=\operatorname{cosec} \mathrm{x}\) repeats its value after every \(2 \pi\) interval.
(ii) \(g(x)=|\sin x|\)

Let \(\mathrm{f}(\mathrm{x})=\sin \mathrm{x}, \mathrm{g}(\mathrm{x})=|\mathrm{f}(\mathrm{x})|\)

Here, the fundamental period of \(|\sin x|\) is \(\pi\) unlike \(\sin x\) whose fundamental period \(2 \pi\). However, one can say that the period of \(|\sin \mathrm{x}|\) is \(2 \pi\).
(iii) \(g(x)=\cos ^{2} x\)

Let \(\mathrm{f}(\mathrm{x})=\cos \mathrm{x}, \mathrm{g}(\mathrm{x})=(\mathrm{f}(\mathrm{x}))^{2}\)

Here, the fundamental period of \(\cos ^{2} x\) is \(\pi\) unlike \(\cos x\) with fundamental period \(2 \pi\). However, one can say that the period of \(\cos ^{2} x\) is \(2 \pi\).

Find the period of the function \(f(x)=\{x\}\), if possible, where \(\{\).\(\} represents the fractional\) part function.

\section*{Solution}
\(f(x)=\{x\},\{\).\(\} is the fractional part function.\)

From the graph, it is clear that the \(\{x\}\) repeats its value after an interval of 1 . So, the period of \(f(x)=\{x\}\) is 1 .

\section*{Property 2}

If a function \(f(x)\) has period \(T\), then \(f(a x+b)\) has period \(\frac{T}{|a|}\)

\section*{Examples:}
(i) \(y=\sin 2 x\)

By the property of periodic functions, \(\sin 2 x\) will have a period of \(\frac{2 \pi}{2}=\pi\)
Let us verify it using the graph of \(\mathrm{y}=\sin 2 \mathrm{x}\)

We can observe that \(\mathrm{y}=\sin 2 \mathrm{x}\) repeats its value after every \(\pi\) interval.
(ii) \(y=\left\{\frac{x}{3}\right\}\) where \(\{\cdot\}\) denotes fractional function

Let \(f(x)=\{x\}, y=f\left(\frac{x}{3}\right)\)
Period of function \(\mathrm{f}(\mathrm{x}), \mathrm{T}=1\)
As the coefficient of \(x\) in the given function \(y\) is \(\frac{1}{3}\), its period is given by \(\frac{T}{\left(\frac{1}{3}\right)}=\frac{1}{\left(\frac{1}{3}\right)}=3\)
\(\Rightarrow\) The period of \(\left\{\frac{x}{3}\right\}\) is 3 .
Let us verify it using the graph of \(y=\left\{\frac{x}{3}\right\}\)

We can observe that \(y=\left\{\frac{x}{3}\right\}\) repeats its value after every interval of 3 .

\section*{Property 3}

Every constant function defined for an unbounded domain is always periodic with no fundamental period.

\section*{Examples:}
(i) \(f(x)=\sin ^{2} x+\cos ^{2} x\), domain is \(\mathbb{R}\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=1\)
This constant function is periodic but with no fundamental period.
(ii) \(f(x)=x \cdot \frac{1}{x}\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=1\)
Domain: \(x \in \mathbb{R}-\{0\}\)

This is a constant function but not a periodic function as the graph does not repeat due to a single discontinuity. This discontinuity does not repeat/occur in regular intervals. Thus, the function can be concluded as non-periodic.
(iii) \(f(x)=\cos x \cdot \sec x\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=1\)
Domain: \(x \in \mathbb{R}-\left\{(2 n+1) \frac{\pi}{2}, n \in \mathbb{Z}\right\}\)
Let us have a look at the graph.

We can say that the values are repeated after every \(\pi\) interval. So, the period of the function is \(\pi\).

\section*{Property 4}

If \(f(x)\) has a period \(T_{1}\) and \(g(x)\) has a period \(T_{2}\), then \(f(x) \pm g(x), f(x) \cdot g(x)\), and \(\frac{f(x)}{g(x)}\) are also
periodic with period L.C.M \(\left(T_{1}, T_{2}\right)\), provided that the L.C.M of \(T_{1}, T_{2}\) exists.
However, the L.C.M need not be a fundamental period.

\section*{Note}
- L.C.M \(\left(\frac{\mathrm{a}}{\mathrm{b}}, \frac{\mathrm{c}}{\mathrm{d}}\right)=\frac{\text { L.C.M }(\mathrm{a}, \mathrm{c})}{\text { H.C.F }(\mathrm{b}, \mathrm{d})} \quad(\mathrm{a}, \mathrm{b}, \mathrm{c}\), and d are rational)
- If the L.C.M of periods of \(\mathrm{f}(\mathrm{x})\) and \(\mathrm{g}(\mathrm{x})\) does not exist, then \(\mathrm{f}(\mathrm{x}) \pm \mathrm{g}(\mathrm{x}), \mathrm{f}(\mathrm{x}) \cdot \mathrm{g}(\mathrm{x}), \frac{\mathrm{f}(\mathrm{x})}{\mathrm{g}(\mathrm{x})}\) are
non-periodic.

Find the period of the following functions:
(i) \(f(x)=\sin \left(\frac{3 x}{2}\right)+\cos \left(\frac{9 x}{4}\right)\)
(ii) \(f(x)=|\sin x|+|\cos x|\)

\section*{Solution}
(i) We know that if \(f(x)\) has period \(T\), then \(f(a x+b)\) has period \(\frac{T}{|a|}\).
\(\therefore \mathrm{T}_{1}=\) Period of \(\sin \left(\frac{3 x}{2}\right)=\frac{2 \times 2 \pi}{3}=\frac{4 \pi}{3}\)
\(\mathrm{T}_{2}=\) Period of \(\cos \left(\frac{9 \mathrm{x}}{4}\right)=\frac{4 \times 2 \pi}{9}=\frac{8 \pi}{9}\)
L.C.M \(\left(\frac{4 \pi}{3}, \frac{8 \pi}{9}\right)=\frac{\text { L.C.M }(4 \pi, 8 \pi)}{\text { H.C.F }(3,9)}=\frac{8 \pi}{3}\)
\(\Rightarrow\) Period of \(\mathrm{f}(\mathrm{x})=\frac{8 \pi}{3}\)
(ii) We know that the period of \(g(x) \pm h(x)\) is the L.C.M of \(\left(T_{1}, T_{2}\right)\), where \(T_{1}\) and \(T_{2}\) are the periods of \(\mathrm{g}(\mathrm{x})\) and \(\mathrm{h}(\mathrm{x})\), respectively.
Period of \(|\sin x|=\pi\)
Period of \(|\cos x|=\pi\)
L.C.M \((\pi, \pi)=\pi\)
\(\Rightarrow\) Period of \(f(x)=\pi\)
\(\pi\) may not be the fundamental period.
Let us check for \(\frac{\pi}{2}\).
\[
\begin{aligned}
\mathrm{f}\left(\mathrm{x}+\frac{\pi}{2}\right) & =\left|\sin \left(\mathrm{x}+\frac{\pi}{2}\right)\right|+\left|\cos \left(\mathrm{x}+\frac{\pi}{2}\right)\right| \\
& =|\cos \mathrm{x}|+|-\sin \mathrm{x}| \\
& =|\cos \mathrm{x}|+|\sin \mathrm{x}|=\mathrm{f}(\mathrm{x})
\end{aligned}
\]
\(\Rightarrow \frac{\pi}{2}\) is also a period of \(f(x)\), which is a fundamental period.

\section*{Property 5}

If \(g\) is a function such that gof is defined on the domain of \(f\) and \(f\) is periodic with period \(T\), then gof is also periodic with T as one of its periods.

\section*{Example:}

Let \(\mathrm{f}(\mathrm{x})=\cos \mathrm{x}, \mathrm{g}(\mathrm{x})=\{\mathrm{x}\}\)
Here, \(f(x)\) has period \(2 \pi\) and \(g(x)\) has period 1 .
\(\operatorname{gof}(\mathrm{x})=\mathrm{g}(\mathrm{f}(\mathrm{x}))=\{\mathrm{f}(\mathrm{x})\}=\{\cos \mathrm{x}\}\)
It is also a periodic function with period \(2 \pi\).
\(\mathrm{fog}(\mathrm{x})=\mathrm{f}(\mathrm{g}(\mathrm{x}))=\cos (\mathrm{g}(\mathrm{x}))=\cos \{\mathrm{x}\}\)
It is also a periodic function with period 1 .

\section*{Note}

If \(g\) is a function such that gof is defined on the domain of \(f\) and \(f\) is non-periodic, then gof may or may not be periodic.

\section*{Example:}

Let \(\mathrm{f}(\mathrm{x})=\mathrm{x}+\sin \mathrm{x}, \mathrm{g}(\mathrm{x})=\cos \mathrm{x}\)
\(f(x)\) is not periodic, while \(g(x)\) is periodic.
Let \(\mathrm{h}(\mathrm{x})=\mathrm{g}(\mathrm{f}(\mathrm{x}))\)
\(\Rightarrow \mathrm{h}(\mathrm{x})=\cos (\mathrm{x}+\sin \mathrm{x})\)
Now, \(h(x+2 \pi)=\cos (x+2 \pi+\sin (x+2 \pi))\)
\[
=\cos (x+\sin x)
\]
\(\Rightarrow \mathrm{h}(\mathrm{x})\), i.e., \(\mathrm{g}(\mathrm{f}(\mathrm{x}))\) is periodic with the period \(2 \pi\).

\section*{Property 6}

The sum or the difference of two periodic functions can be non-periodic, while the sum or the difference of two non-periodic functions can be periodic.

\section*{Examples:}
(i) \(f(x)=\{x\}+\sin x\)

We know that the period of \(\{x\}\) is 1 and the period of \(\sin x\) is \(2 \pi\).
And L.C.M \((1,2 \pi)\) does not exist.
So, \(\{\mathrm{x}\}+\sin \mathrm{x}\) is not periodic.
(ii) \(f(x)=x-[x]\) (Where [.] represents the G.I.F.)

Both \(x\) and \([x]\) are non-periodic functions.
However, \(\mathrm{x}-[\mathrm{x}]=\{\mathrm{x}\}\) is periodic with the fundamental period as 1 .

Find the fundamental period of the function \(f(x)=\cos (\sin x)+\cos (\cos x)\)
(a) \(2 \pi\)
(b) \(\pi\)
(c) \(\frac{\pi}{2}\)
(d) \(\frac{3 \pi}{2}\)

\section*{Solution}
\(f(x+2 \pi)=\cos (\sin (x+2 \pi))+\cos (\cos (x+2 \pi))=\cos (\sin x)+\cos (\cos x)\)
\(f(x+\pi)=\cos (\sin (x+\pi))+\cos (\cos (x+\pi))=\cos (\sin x)+\cos (\cos x)\)
\(f\left(x+\frac{\pi}{2}\right)=\cos \left(\sin \left(x+\frac{\pi}{2}\right)\right)+\cos \left(\cos \left(x+\frac{\pi}{2}\right)\right)=\cos (\sin x)+\cos (\cos x)\)
\(\therefore\) The fundamental period of \(\mathrm{f}(\mathrm{x})\) is \(\frac{\pi}{2}\).
So, option (c) is the correct answer.

If fundamental period of \(f(x)=\sin ([a] x)\) is \(\pi\), where [.] represents greatest integer function, then what is the range of value of \(a\) ?
(a) \(a \in[3, \infty)\)
(b) \(\mathrm{a} \in(1,3)\)
(c) \(a \in[2,3)\)
(d) \(a \in(-2,0)\)

\section*{Solution}

Given, fundamental period of \(f(x)=\sin ([a] x)\) is \(\pi\).
\(\Rightarrow \pi=\frac{2 \pi}{[\mathrm{a}]}\)
\(\Rightarrow[\mathrm{a}]=2\)
\(\Rightarrow \mathrm{a} \in[2,3)\)
\(\therefore\) Option (c) is the correct answer.

Find the period of \(f(x)+f(x+1)=0, \forall x \in \mathbb{R}\).

\section*{Solution}

Given, \(\mathrm{f}(\mathrm{x})+\mathrm{f}(\mathrm{x}+1)=0 \ldots\) (i)
On replacing \(x\) by \(x+1\), we get,
\(f(x+1)+f(x+2)=0\)
On subtracting equation (i) from equation (ii), we get,
\(\mathrm{f}(\mathrm{x}+2)-\mathrm{f}(\mathrm{x})=0\)
\(\Rightarrow f(x+2)=f(x)\)
\(\therefore \mathrm{f}(\mathrm{x})\) is periodic with period 2 .

\section*{?}

\section*{Concept Check}
1. Find the period of the function \(\mathrm{f}(\mathrm{x})=[\mathrm{x}]\), if possible, where [.] represents the G.I.F.
2. Find the period of the function \(f(x)=\sqrt{\sec (3 x-1)}\)

\section*{Summary Sheet}

\section*{Key Takeaways}
- If the functions \(f\) and \(g\) are one-one functions, then gof, if defined, will be a one-one function.
- If the functions \(f\) and \(g\) are bijective functions and gof is defined, then gof will be a bijection iff range of \(f\) is equal to the domain of \(g\).
- The composition of functions (which are either even or odd) will be even, if at least one of them is even.
- A function \(\mathrm{f}(\mathrm{x})\) is said to be a periodic function if there exists a positive real number T , such that \(\mathrm{f}(\mathrm{x}+\mathrm{T})=\mathrm{f}(\mathrm{x}), \forall \mathrm{x} \in \mathrm{D}_{\mathrm{f}} ; \mathrm{T}>0\)
- If a function \(\mathrm{f}(\mathrm{x})\) has period T , then \(\frac{1}{\mathrm{f}(\mathrm{x})},(\mathrm{f}(\mathrm{x}))^{\mathrm{n}}(\mathrm{n} \in \mathbb{N}),|\mathrm{f}(\mathrm{x})|, \sqrt{\mathrm{f}(\mathrm{x})}\) also have period T . (T may or may not be a fundamental period)
- If a function \(f(x)\) has period \(T\), then \(f(a x+b)\) has period \(\frac{T}{|a|}\).
- Every constant function defined for an unbounded domain is always periodic with no fundamental period.
- If \(\mathrm{f}(\mathrm{x})\) has a period \(\mathrm{T}_{1}\) and \(\mathrm{g}(\mathrm{x})\) has a period \(\mathrm{T}_{2}\), then \(\mathrm{f}(\mathrm{x}) \pm \mathrm{g}(\mathrm{x}), \mathrm{f}(\mathrm{x}) \cdot \mathrm{g}(\mathrm{x})\), and \(\frac{\mathrm{f}(\mathrm{x})}{\mathrm{g}(\mathrm{x})}\) are also
periodic with period L.C.M \(\left(\mathrm{T}_{1}, \mathrm{~T}_{2}\right)\), provided that the L.C.M of \(\mathrm{T}_{1}, \mathrm{~T}_{2}\) exists.
- If \(g\) is a function such that gof is defined on the domain of \(f\) and \(f\) is periodic with period \(T\), then gof is also periodic with T as one of its periods.
- If \(g\) is a function such that gof defined on the domain of \(f\) and \(f\) is non-periodic, then gof may or may not be periodic.
- The sum or the difference of two periodic functions can be non-periodic, while the sum or the difference of two non-periodic functions can be periodic.

\section*{Self-Assessment}

Find the period of the function \(\frac{\sin x+\cos x}{\sqrt{2}}\).

\section*{Concept Check}
1. Let us see the graph of the G.I.F. \(y=[x]\).

The values does not repeat after any interval of x . \(\operatorname{So}, \mathrm{f}(\mathrm{x})=[\mathrm{x}]\) is not periodic.
2. If a function \(f(x)\) has period \(T\), then \(\frac{1}{f(x)},(f(x))^{n}(n \in \mathbb{N}),|f(x)|, \sqrt{f(x)}\) also have period \(T\) (T may or may not be a fundamental period). If a function \(f(x)\) has period \(T\), then \(f(a x+b)\) has period \(\frac{T}{|a|}\).
\(\Rightarrow\) Period of \(\mathrm{f}(\mathrm{x})=\sqrt{\sec (3 \mathrm{x}-1)}=\frac{2 \pi}{3}\)

\section*{Self-Assessment}

Given, \(\frac{\sin x+\cos x}{\sqrt{2}}\)
Let \(\mathrm{f}(\mathrm{x})=\left(\frac{1}{\sqrt{2}} \sin \mathrm{x}+\frac{1}{\sqrt{2}} \cos \mathrm{x}\right)\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=\sin \left(\mathrm{x}+\frac{\pi}{4}\right)\)
Therefore, period is same as the \(\sin \mathrm{x}\) function, which is \(2 \pi\).

\title{
RELATIONS AND FUNCTIONS
}

INVERSE FUNCTIONS

\section*{What you already know}
- Periodic functions
- Properties of periodic functions

\section*{What you will learn}
- Inverse function
- Properties of inverse function

\section*{Inverse Function}

Let \(\mathrm{y}=\mathrm{f}(\mathrm{x}): \mathrm{A} \rightarrow \mathrm{B}\) be a one-one and onto function, i.e., a bijection. Then, there exists a function \(x=g(y): B \rightarrow A\) such that if \((\alpha, \beta) \in f \Rightarrow(\beta, \alpha) \in g\)
Then \(f\) and \(g\) are said to be invertible functions of each other.
\(\mathrm{g}=\mathrm{f}^{-1}: \mathrm{B} \rightarrow \mathrm{A}=\{(\mathrm{f}(\mathrm{x}), \mathrm{x}) \mid(\mathrm{x}, \mathrm{f}(\mathrm{x})) \in \mathrm{f}\}\)
Why does a function have to be bijective to be invertible?

\section*{Case 1: Many-one function}

Let us consider a many-one function \(f\). Then, its inverse \(\mathrm{f}^{-1}\) is not a function as shown in the given figure.

\section*{Case 2: Into function}

Let us consider a into function f . Then, its inverse \(\mathrm{f}^{-1}\) is not a function as shown in the given figure.

\section*{Case 3: Both one-one and onto function}

Let us consider a one-one and onto (bijective) function \(f\). Then, its inverse \(\mathrm{f}^{-1}\) is also a one-one and onto function as shown in the given figure.

Here, \(\mathrm{f}^{-1}\) is also a bijective function.
Hence, the inverse of a bijection is unique and also a bijection.

\section*{To find the inverse:}

Step 1: Let \(\mathrm{y}=\mathrm{f}(\mathrm{x})\)
Step 2: Express \(x\) in terms of \(y, x=g(y)\)
Step 3: Now, we get the inverse, i.e., \(\mathrm{f}^{-1}(\mathrm{x})\).

\section*{Note}

To get the inverse in step 3 , \(y\) is replaced by \(x\). Therefore, the domain and the range of \(f(x)\) become the range and the domain of \(\mathrm{f}^{-1}(\mathrm{x})\), respectively.

\section*{Example}

If \(f(x)=\frac{2 x+3}{4}, f: \mathbb{R} \rightarrow \mathbb{R}\), then find its inverse.

\section*{Solution}

Since \(f(x)\) is a linear function, it is a bijective function.
Hence, the inverse of function \(f(x)\) exists.
Given,
\(y=f(x)=\frac{2 x+3}{4}\)
\(\Rightarrow 4 y=2 x+3\)
\(\Rightarrow \mathrm{x}=\frac{4 \mathrm{y}-3}{2}\)
\(g(x)=f^{-1}(x)=\frac{4 x-3}{2} ; g: \mathbb{R} \rightarrow \mathbb{R}\)

\section*{Observation:}

Let us plot a graph of \(f(x)\) and \(f^{-1}(x)\).
From the figure, we can see that \(\mathrm{f}(\mathrm{x})\) and \(\mathrm{f}^{-1}(\mathrm{x})\) are the mirror images of each other about the line \(y=x\)

\section*{\(f(x)=x^{2}+x+1 ; f:[0, \infty) \rightarrow[1, \infty)\). Find its inverse.}

\section*{Solution}

\section*{Step 1:}

The given quadratic function \(y=f(x)\) can be plotted as shown in the figure.
For \(\mathrm{x} \in[0, \infty), \mathrm{f}(\mathrm{x})\) is a one-one function (by horizontal line test)
For \(\mathrm{x} \in[0, \infty), \mathrm{y} \in[1, \infty)\)
Hence, Range of \(f(x)=\) Codomain of \(f(x)\)
\(\Rightarrow f(x)\) is an onto function.
Hence, function \(f(x)\) is bijective and its inverse exists.

\section*{Step 2:}

Given, \(y=x^{2}+x+1\)
\(\Rightarrow \mathrm{x}^{2}+\mathrm{x}+(1-\mathrm{y})=0\)
\(\Rightarrow \mathrm{x}=\frac{-1 \pm \sqrt{1-4(1-\mathrm{y})}}{2}\)
\(\Rightarrow \mathrm{x}=\frac{-1 \pm \sqrt{4 \mathrm{y}-3}}{2}\)
We know that the domain of a function is the range of its inverse.
\(\Rightarrow\) The range of \(f^{-1}(x)\) is \([0, \infty)\).
So, \(y=\frac{-1-\sqrt{4 x-3}}{2}\) cannot be inverse of the function.
Hence, the inverse of the function is given as follows:
\(f^{-1}(x)=y=\frac{-1+\sqrt{4 x-3}}{2}\)

\section*{Properties of Inverse Function}

\section*{Property 1}

The graphs of function \(f\) and its inverse \(g\) are the mirror images of each other about the line \(y=x\)

\section*{Example:}
\(\mathrm{f}(\mathrm{x})=\mathrm{e}^{\mathrm{x}}, \mathrm{g}(\mathrm{x})=\mathrm{f}^{-1}(\mathrm{x})=\ln \mathrm{x}\)
So, they can be plotted as shown in the figure.

Hence, the function and its inverse are the mirror images of each other about the line \(\mathrm{y}=\mathrm{x}\)

\section*{Property 2}

If functions \(f\) and \(f^{-1}\) intersect, then at least one point of intersection lie on the line \(\mathrm{y}=\mathrm{x}\)
Let us consider a function \(f(x)=x^{3}\), then the inverse of function \(f^{-1}(x)\) intersects \(y=x\) as shown in the figure.

Let us consider another function \(\mathrm{f}(\mathrm{x})=\frac{1}{\mathrm{x}}\) Then, its inverse function \(\mathrm{f}^{-1}(\mathrm{x})=\frac{1}{\mathrm{x}}\) is an example of self-inverse.

Find the solution of the given equation.
\[
x^{2}-3 x=\frac{3-\sqrt{9+4 x}}{2}, x \in\left[\frac{-9}{4}, 1\right]
\]

\section*{Solution}

\section*{Step 1:}

Given, \(x^{2}-3 x=\frac{3-\sqrt{9+4 x}}{2}, x \in\left[\frac{-9}{4}, 1\right]\)
Let \(\mathrm{y}=\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}-3 \mathrm{x}\)
For \(\mathrm{x} \in\left[\frac{-9}{4}, 1\right], \mathrm{f}(\mathrm{x})\) is bijective
Hence, its inverse exists.
\(y=x^{2}-3 x\)
\(\mathrm{x}^{2}-3 \mathrm{x}-\mathrm{y}=0\)
\(x=\frac{3 \pm \sqrt{9+4 y}}{2}\)

By interchanging \(x\) and \(y\), we get,
\(y=\frac{3 \pm \sqrt{9+4 x}}{2}\)

\section*{Step 2:}

We know that the domain of a function is the range of its inverse.
\(\Rightarrow\) The range of \(\mathrm{f}^{-1}(\mathrm{x})\) is \(\left[\frac{-9}{4}, 1\right]\).
So, \(\mathrm{y}=\frac{3+\sqrt{9+4 \mathrm{x}}}{2}\) cannot be the inverse of the function.
Hence, the inverse of the function is given as follows:
\(\mathrm{f}^{-1}(\mathrm{x})=\frac{3-\sqrt{9+4 \mathrm{x}}}{2}\)

\section*{Step 3:}

Hence, the equation is of form \(f(x)=f^{-1}(x)\)
We know that if functions \(f\) and \(f^{-1}\) intersect, then at least one point of intersection lie on the line \(\mathrm{y}=\mathrm{x}\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{x}^{2}-3 \mathrm{x}=\mathrm{x}\)
\(\Rightarrow \mathrm{x}^{2}-4 \mathrm{x}=0\)
\(\Rightarrow \mathrm{x}(\mathrm{x}-4)=0\)
\(\Rightarrow \mathrm{x}=0,4\)
However, \(\mathrm{x} \in\left[\frac{-9}{4}, 1\right]\)
\(\Rightarrow \mathrm{x}=0\)

\section*{Property 3}

If \(f\) and \(g\) are the inverse of each other, then fog = gof = x
Let us consider the mapping shown in the figure.
Here, we can see that,
\(\mathrm{fog}(\mathrm{a})=\mathrm{f}(\mathrm{g}(\mathrm{a}))=\mathrm{f}(3)=\mathrm{a}\)
\(f o g(b)=f(g(b))=f(1)=b\)
fog \((\mathrm{c})=\mathrm{f}(\mathrm{g}(\mathrm{c}))=\mathrm{f}(2)=\mathrm{c}\)
\(\operatorname{gof}(1)=g(f(1))=g(b)=1\)

\(\operatorname{gof}(2)=g(f(2))=g(c)=2\)
\(\operatorname{gof}(3)=g(f(3))=g(a)=3\)
Can we conclude if \(\mathrm{fog}=\mathrm{gof} \Rightarrow \mathrm{f}\) and g are inverses of each other?
No, fog and gof can be equal even if \(f\) and \(g\) are not the inverse of each other. However, in that case, fog = gof \(\neq \mathrm{x}\)
Let us consider two functions, \(\mathrm{f}(\mathrm{x})=\mathrm{x}+2\) and \(\mathrm{g}(\mathrm{x})=\mathrm{x}+1\)
\(f o g(x)=f(g(x))=g(x)+2=x+3\)
\(\operatorname{gof}(x)=g(f(x))=f(x)+1=x+3\)
Hence, fog \(=\) gof \(\neq x\)
Thus, fog \(=\) gof, but \(f\) and \(g\) are not inverse of each other.

\section*{Property 4}

If \(f: A \rightarrow B\) and \(g: B \rightarrow C\) are two bijections, then inverse of gof exists and (gof) \({ }^{-1}=f^{-1} \mathrm{og}^{-1}\)

\section*{Example:}
\[
\begin{aligned}
& \mathrm{f}(\mathrm{x})=\mathrm{x}+1, \mathrm{~g}(\mathrm{x})=2 \mathrm{x}-1 \\
& \mathrm{gof}(\mathrm{x})=\mathrm{g}(\mathrm{f}(\mathrm{x}))=\mathrm{g}(\mathrm{x}+1)=2(\mathrm{x}+1)-1=2 \mathrm{x}+1 \\
& 2 \mathrm{x}+1=\mathrm{y} \Rightarrow \mathrm{x}=\frac{\mathrm{y}-1}{2} \\
& \Rightarrow(\mathrm{gof})^{-1}(\mathrm{x})=\frac{\mathrm{x}-1}{2} \\
& \mathrm{y}=\mathrm{x}+1 \Rightarrow \mathrm{x}=\mathrm{y}-1 \\
& \Rightarrow \mathrm{f}^{-1}(\mathrm{x})=\mathrm{x}-1 \\
& \text { and, } 2 \mathrm{x}-1=\mathrm{y} \Rightarrow \mathrm{x}=\frac{\mathrm{y}+1}{2} \\
& \Rightarrow \mathrm{~g}^{-1}(\mathrm{x})=\frac{\mathrm{x}+1}{2} \\
& \mathrm{f}^{-1} \mathrm{og}^{-1}(\mathrm{x})=\mathrm{f}^{-1}\left(\mathrm{~g}^{-1}(\mathrm{x})\right)=\mathrm{f}^{-1}\left(\frac{\mathrm{x}+1}{2}\right)=\frac{\mathrm{x}-1}{2}
\end{aligned}
\]

Hence \((\mathrm{gof})^{-1}=\mathrm{f}^{-1} \mathrm{og}^{-1}\)

If \(f(x)=a x+b\) and the equation \(f(x)=f^{-1}(x)\) can be satisfied by every real value of \(x\), then
(a) \(\mathrm{a}=2, \mathrm{~b}=-1\)
(b) \(a=-1, b \in \mathbb{R}\)
(c) \(\mathrm{a}=1, \mathrm{~b} \in \mathbb{R}\)
(d) \(a=1, b=-1\)

\section*{Solution}
\(f(x)=y=a x+b \Rightarrow x=\frac{y}{a}-\frac{b}{a}\)
\(\Rightarrow \mathrm{f}^{-1}(\mathrm{x})=\frac{\mathrm{x}}{\mathrm{a}}-\frac{\mathrm{b}}{\mathrm{a}}\)
Given, \(\mathrm{f}(\mathrm{x})=\mathrm{f}^{-1}(\mathrm{x}) \forall \mathrm{x} \in \mathbb{R}\)
\(\Rightarrow \mathrm{ax}+\mathrm{b}=\frac{\mathrm{x}}{\mathrm{a}}-\frac{\mathrm{b}}{\mathrm{a}}\)
\(\Rightarrow \frac{1}{\mathrm{a}}=\mathrm{a}, \mathrm{b}=-\frac{\mathrm{b}}{\mathrm{a}}\)
\(\Rightarrow \mathrm{a}^{2}=1 \Rightarrow \mathrm{a}= \pm 1 \quad(\mathrm{a} \neq 0)\)
If \(\mathrm{a}=1 \Rightarrow \mathrm{~b}=-\mathrm{b} \Rightarrow \mathrm{b}=0\)
If \(a=-1 \Rightarrow b=b \Rightarrow b \in \mathbb{R}\)
Hence, option (b) is the correct answer.

\section*{Concept Check}
1. Find the inverse function of \(f(x)=\frac{8^{2 x}-8^{-2 x}}{8^{2 x}+8^{-2 x}}, x \in(-1,1)\)

JEE MAIN 2020
(a) \(\frac{1}{4} \log _{8} \mathrm{e} \times \log _{\mathrm{e}}\left(\frac{1-\mathrm{x}}{1+\mathrm{x}}\right)\)
(b) \(\frac{1}{4} \log _{8} \mathrm{e} \times \log _{e}\left(\frac{1+\mathrm{x}}{1-\mathrm{x}}\right)\)
(c) \(\frac{1}{4} \log _{e}\left(\frac{1+x}{1-x}\right)\)
(d) \(\frac{1}{4} \log _{e}\left(\frac{1-x}{1+x}\right)\)
2. Find the inverse of the following function (assuming one-one and onto):
\[
y=\log _{a}\left(x+\sqrt{x^{2}+1}\right),(a>1)
\]
3. Let \(\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}\) be an invertible function defined by \(f(x)=\frac{e^{x}-e^{-x}}{2}\). Find its inverse.

\section*{Summary Sheet}

\section*{Key Takeaways}
- Let \(\mathrm{y}=\mathrm{f}(\mathrm{x}): \mathrm{A} \rightarrow \mathrm{B}\) be a one-one and onto function, i.e., a bijection. Then, there exists a function \(x=g(y): B \rightarrow A\) such that if \((\alpha, \beta) \in f \Rightarrow(\beta, \alpha) \in g\)
Then \(f\) and \(g\) are said to be invertible functions of each other.
- The inverse of a bijection is unique and also a bijection.
- The graphs of function \(f\) and its inverse \(g\) are the mirror images of each other about the line \(\mathrm{y}=\mathrm{x}\)
- If functions f and \(\mathrm{f}^{-1}\) intersect, then at least one point of intersection lies on the line \(\mathrm{y}=\mathrm{x}\)
- If \(f\) and \(g\) are the inverse of each other, then \(f o g=g o f=x\)
- If \(\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}\), and \(\mathrm{g}: \mathrm{B} \rightarrow \mathrm{C}\) are two bijections, then the inverse of gof exists and \((\mathrm{gof})^{-1}=\mathrm{f}^{-1} \mathrm{og}^{-1}\)

\section*{Mind Map}

Inverse function

\section*{Properties of inverse function}

\section*{Self-Assessment}

If \(f(x)=3 x-2\) and \((\text { gof })^{-1}(x)=x-2\), then find the function \(g(x)\).

\section*{Concept Check}
1. Let \(\mathrm{f}(\mathrm{x})=\mathrm{y}=\frac{8^{2 x}-8^{-2 x}}{8^{2 x}+8^{-2 x}} \Rightarrow \mathrm{y}=\frac{8^{4 x}-1}{8^{4 x}+1}\)
\(\Rightarrow y \times 8^{4 x}+y=8^{4 x}-1 \Rightarrow 8^{4 x}=\frac{y+1}{1-y}\)
\(\Rightarrow 4 \mathrm{x}=\log _{8}\left(\frac{\mathrm{y}+1}{1-\mathrm{y}}\right) \Rightarrow \mathrm{x}=\frac{1}{4} \log _{8}\left(\frac{\mathrm{y}+1}{1-\mathrm{y}}\right)\)
\(\Rightarrow \mathrm{x}=\frac{1}{4} \log _{8} \mathrm{e} \times \log _{\mathrm{e}}\left(\frac{\mathrm{y}+1}{1-\mathrm{y}}\right)=\mathrm{g}(\mathrm{y}) \quad\left\{\log _{\mathrm{b}} \mathrm{a} \cdot \log _{\mathrm{c}} \mathrm{b}=\log _{\mathrm{c}} \mathrm{a}\right\}\)
\(\therefore \mathrm{g}(\mathrm{x})=\mathrm{f}^{-1}(\mathrm{x})=\frac{1}{4} \log _{8} \mathrm{e} \times \log _{\mathrm{e}}\left(\frac{\mathrm{x}+1}{1-\mathrm{x}}\right)\)

\section*{Hence, option (b) is the correct answer.}
2. \(y=\log _{a}\left(x+\sqrt{x^{2}+1}\right),(a>1)\)
\(a^{y}=x+\sqrt{x^{2}+1}\)
\(\Rightarrow a^{-y}=\frac{1}{x+\sqrt{x^{2}+1}} \Rightarrow a^{-y}=\frac{1}{x+\sqrt{x^{2}+1}} \cdot \frac{-x+\sqrt{x^{2}+1}}{-x+\sqrt{x^{2}+1}}\)
\(\Rightarrow a^{-y}=-x+\sqrt{x^{2}+1}\)
By subtracting (2) from (1), we get,
\(\mathrm{a}^{\mathrm{y}}-\mathrm{a}^{-\mathrm{y}}=2 \mathrm{x} \Rightarrow \mathrm{x}=\frac{1}{2}\left(\mathrm{a}^{\mathrm{y}}-\mathrm{a}^{-\mathrm{y}}\right)\)
\(\mathrm{f}^{-1}(\mathrm{x})=\frac{1}{2}\left(\mathrm{a}^{\mathrm{x}}-\mathrm{a}^{-\mathrm{x}}\right)\)
3. \(f(x)=\frac{e^{x}-e^{-x}}{2}=y\)
\(\Rightarrow \mathrm{e}^{\mathrm{x}}-\frac{1}{\mathrm{e}^{\mathrm{x}}}=2 \mathrm{y} \Rightarrow \mathrm{e}^{2 \mathrm{x}}-2 \mathrm{ye}^{\mathrm{x}}-1=0\)
After substituting \(\mathrm{e}^{\mathrm{x}}=\mathrm{t}\), we get,
\(\mathrm{t}^{2}-2 \mathrm{yt}-1=0 \Rightarrow \mathrm{t}=\frac{2 \mathrm{y} \pm \sqrt{4 \mathrm{y}^{2}+4}}{2}\)
\(\Rightarrow \mathrm{e}^{\mathrm{x}}=\mathrm{y} \pm \sqrt{\mathrm{y}^{2}+1}\)
Since \(\mathrm{e}^{\mathrm{x}}<0\) is not possible,
\[
\begin{aligned}
& \Rightarrow \mathrm{e}^{\mathrm{x}}=\mathrm{y}+\sqrt{\mathrm{y}^{2}+1} \Rightarrow \mathrm{x}=\log \left(\mathrm{y}+\sqrt{\mathrm{y}^{2}+1}\right) \\
& \Rightarrow \mathrm{f}^{-1}(\mathrm{x})=\log \left(\mathrm{x}+\sqrt{\mathrm{x}^{2}+1}\right)
\end{aligned}
\]

\section*{Self-Assessment}
\(f(x)=y=3 x-2 \Rightarrow x=\frac{y+2}{3}\)
\(\mathrm{f}^{-1}(\mathrm{x})=\frac{\mathrm{x}+2}{3}\)
Given, \((\text { gof })^{-1}(x)=x-2\)
\[
\begin{aligned}
& \Rightarrow \frac{g^{-1}(x)+2}{3}=x-2 \Rightarrow g^{-1}(x)=3 x-8 \\
& \Rightarrow g(x)=\frac{x+8}{3}
\end{aligned}
\]

\section*{Functional equation}

If \(x\) and \(y\) are independent real variables, then,
(i) \(\mathrm{f}(\mathrm{x}+\mathrm{y})=\mathrm{f}(\mathrm{x})+\mathrm{f}(\mathrm{y}) \Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{kx} ; \mathrm{k} \in \mathbb{R}\)

\section*{Justification:}
\[
\mathrm{f}(\mathrm{x})=\mathrm{kx}
\]
\[
f(x+y)=k(x+y)=k x+k y=f(x)+f(y)
\]
(ii) \(\mathrm{f}(\mathrm{x}+\mathrm{y})=\mathrm{f}(\mathrm{x}) \mathrm{f}(\mathrm{y}) \Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{a}^{\mathrm{kx}} ; \mathrm{k} \in \mathbb{R}\) and \(\mathrm{a}>0\)

\section*{Justification:}
\(\mathrm{f}(\mathrm{x})=\mathrm{a}^{\mathrm{kx}}\)
\(f(x+y)=a^{k(x+y)}=a^{k x} \times a^{k y}=f(x) f(y)\)
(iii) \(f(x y)=f(x)+f(y) \Rightarrow f(x)=k \ln x ; k \in \mathbb{R}, x>0\)

\section*{Justification:}
\(\mathrm{f}(\mathrm{x})=\mathrm{k} \ln \mathrm{x}\)
\(f(x y)=k \ln (x y)=k(\ln x+\ln y)=k \ln x+k \ln y=f(x)+f(y)\)
(iv) \(\mathrm{f}(\mathrm{xy})=\mathrm{f}(\mathrm{x}) \mathrm{f}(\mathrm{y}) \Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{x}^{\mathrm{n}} ; \mathrm{n} \in \mathbb{R}\)

Justification:
\(\mathrm{f}(\mathrm{x})=\mathrm{x}^{\mathrm{n}}\)
\(\mathrm{f}(\mathrm{xy})=(\mathrm{xy})^{\mathrm{n}}=\mathrm{x}^{\mathrm{n}} \mathrm{y}^{\mathrm{n}}=\mathrm{f}(\mathrm{x}) \mathrm{f}(\mathrm{y})\)
(v) If \(f(x)\) is a polynomial of degree \(n\) such that \(f(x) f\left(\frac{1}{x}\right)=f(x)+f\left(\frac{1}{x}\right) \Rightarrow f(x)=1 \pm x^{n} ; n \in \mathbb{R}\)

\section*{Justification:}
\(\mathrm{f}(\mathrm{x})=1 \pm \mathrm{x}^{\mathrm{n}}\)
\[
\mathrm{f}(\mathrm{x}) \mathrm{f}\left(\frac{1}{\mathrm{x}}\right)=\left(1 \pm \mathrm{x}^{\mathrm{n}}\right)\left(1 \pm\left(\frac{1}{\mathrm{x}}\right)^{\mathrm{n}}\right)=1 \pm\left(\frac{1}{\mathrm{x}}\right)^{\mathrm{n}} \pm \mathrm{x}^{\mathrm{n}}+\mathrm{l}=\mathrm{f}(\mathrm{x})+\mathrm{f}\left(\frac{1}{\mathrm{x}}\right)
\]
\begin{tabular}{|c|c|}
\hline Condition & Function \\
\hline\(f(x+y)=f(x)+f(y)\) & \(f(x)=k x ; k \in \mathbb{R}\) \\
\hline\(f(x+y)=f(x) f(y)\) & \(f(x)=a^{k x} ; k \in \mathbb{R}\) and \(a>0\) \\
\hline\(f(x y)=f(x)+f(y)\) & \(f(x)=k \ln x ; k \in \mathbb{R}, x>0\) \\
\hline\(f(x y)=f(x) f(y)\) & \(f(x)=1 \pm x^{n} ; n \in \mathbb{R}, n\) \\
\hline \begin{tabular}{l} 
If \(f(x)\) is a polynomial of degree \(n\) such that \\
\(f(x) f\left(\frac{1}{x}\right)=f(x)+f\left(\frac{1}{x}\right)\)
\end{tabular} & \\
\hline
\end{tabular}

If a function \(f(x)\) satisfies the relation \(f(x+y)=f(x)+f(y)\), where \(x, y \in \mathbb{R}\) and \(f(1)=4\), then find the value of \(\sum_{r=1}^{10} f(r)\).
(a) 100
(b) 220
(c) 160
(d) 300

\section*{Solution}

\section*{Step 1:}

Given,
\(f(x+y)=f(x)+f(y)\)
\(\Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{kx}\)
It is also given that,
\(\mathrm{f}(1)=4\)
\(\Rightarrow \mathrm{k}(1)=4\)
\(\Rightarrow \mathrm{k}=4\)
\(\therefore\) The function is \(\mathrm{f}(\mathrm{x})=4 \mathrm{x}\)

\section*{Step 2:}

Now,
\[
\begin{aligned}
\sum_{\mathrm{r}=1}^{10} \mathrm{f}(\mathrm{r}) & =\mathrm{f}(1)+\mathrm{f}(2)+\ldots+\mathrm{f}(10) \\
& =4+4(2)+4(3)+\ldots+4(10) \\
& =4(1+2+3+\ldots+10) \\
& =4 \times \frac{10}{2} \times(10+1) \quad\left(\sum \mathrm{n}=\frac{\mathrm{n}(\mathrm{n}+1)}{2}\right)
\end{aligned}
\]
\[
=220
\]
\(\therefore\) Option (b) is the correct answer.
? If \(f(x)\) is a polynomial function such that \(f(x) f\left(\frac{1}{x}\right)=f(x)+f\left(\frac{1}{x}\right)\) and \(f(3)=-26\), then find \(f(4)\).
(a) 64
(b) -65
(c) -63
(d) 65

\section*{Solution}

\section*{Step 1:}

Given,
\(\mathrm{f}(\mathrm{x}) \mathrm{f}\left(\frac{1}{\mathrm{x}}\right)=\mathrm{f}(\mathrm{x})+\mathrm{f}\left(\frac{1}{\mathrm{x}}\right) \Rightarrow \mathrm{f}(\mathrm{x})=1 \pm \mathrm{x}^{\mathrm{n}}\)
Also given,
\(f(3)=-26 \Rightarrow 1 \pm 3^{n}=-26\)

\section*{Step 2:}

Now, we have two cases,

\section*{Case I:}
\(1+3^{n}=-26\)

Thus, we have the function \(f(x)=1-x^{3}\)
\(\therefore \mathrm{f}(4)=1-4^{3}=-63\)
\(\therefore\) Option (c) is the correct answer.
\(\Rightarrow 3^{n}=-27\)
It is not possible.

\section*{Case II:}
\(1-3^{n}=-26\)
\(\Rightarrow 3^{\mathrm{n}}=27 \Rightarrow \mathrm{n}=3\)

Let the function \(f:[0,1] \rightarrow \mathbb{R}\) be defined by \(f(x)=\frac{4^{x}}{4^{x}+2}\), then find the value of
\[
f\left(\frac{1}{40}\right)+f\left(\frac{2}{40}\right)+f\left(\frac{3}{40}\right)+\ldots+f\left(\frac{39}{40}\right)-f\left(\frac{1}{2}\right)
\]

\section*{Solution}

\section*{Step 1:}
\[
\begin{aligned}
f(x)+f(1-x) & =\frac{4^{x}}{4^{x}+2}+\frac{4^{1-x}}{4^{1-x}+2} \\
& =\frac{4^{x}}{4^{x}+2}+\frac{\frac{4}{4^{x}}}{\frac{4}{4^{x}}+2} \\
& =\frac{4^{x}}{4^{x}+2}+\frac{2}{2+4^{x}} \\
& =\frac{4^{x}+2}{4^{x}+2}=1
\end{aligned}
\]
\(\therefore \mathrm{f}(\mathrm{x})+\mathrm{f}(1-\mathrm{x})=1\)

\section*{Step 2:}
\(\mathrm{f}\left(\frac{1}{40}\right)+\mathrm{f}\left(\frac{2}{40}\right)+\ldots+\mathrm{f}\left(\frac{19}{40}\right)+\mathrm{f}\left(\frac{20}{40}\right)+\ldots+\mathrm{f}\left(\frac{38}{40}\right)+\mathrm{f}\left(\frac{39}{40}\right)-\mathrm{f}\left(\frac{1}{2}\right)\)
\(=\left\{\mathrm{f}\left(\frac{1}{40}\right)+\mathrm{f}\left(\frac{39}{40}\right)\right\}+\left\{\mathrm{f}\left(\frac{2}{40}\right)+\mathrm{f}\left(\frac{38}{40}\right)\right\}+\ldots+\mathrm{f}\left(\frac{20}{40}\right)-\mathrm{f}\left(\frac{1}{2}\right)\)
\(=1+1+1+\ldots 19\) terms
\(=19\)

\section*{Transformation of Graphs}

\section*{Horizontal shift}

Let us consider a function \(\mathrm{y}=\mathrm{f}(\mathrm{x})\) intersecting the X -axis at \((\alpha, 0)\) and \((\beta, 0)\) as shown in the figure.

When the given graph of \(f(x)\) is shifted by \(k\) units toward the left, it gives the graph of the function \(y=f(x+k),(k>0)\)

In this case, the graph cuts the X -axis at the points \((\alpha-k, 0)\) and \((\beta-k, 0)\) as shown in the figure.

When the given graph of \(f(x)\) is shifted by k units toward the right, it gives the graph of the function \(y=f(x-k),(k>0)\)
In this case, the graph cuts the X -axis at the points \((\alpha+k, 0)\) and \((\beta+k, 0)\) as shown in the figure.

Plot graph of the function \(y=\cos \left(x-\frac{\pi}{2}\right)\)

\section*{Solution}

Step 1: Plot the graph of the function \(y=\cos x\)

Step 2: Shift the graph of \(y=\cos x\) in the direction of positive \(X\)-axis (by \(\frac{\pi}{2}\) units) to get the graph of \(\mathrm{y}=\cos \left(\mathrm{x}-\frac{\pi}{2}\right)\)

\section*{Vertical shift}

Let us consider a function \(y=f(x)\) having minimum value a as shown in the figure.

When the given graph of \(f(x)\) is shifted upwards by k units, it gives the graph of the function \(\mathrm{y}=\mathrm{f}(\mathrm{x})+\mathrm{k} ; \mathrm{k}>0\)

In this case, the minimum value of the function \(y=f(x)+k\) is \(a+k\)

When the given graph of \(f(x)\) is shifted downwards by \(k\) units, it gives the graph of the function \(y=f(x)-k ; k>0\)

In this case, the minimum value of the function \(\mathrm{y}=\mathrm{f}(\mathrm{x})-\mathrm{k}\) is \(\mathrm{a}-\mathrm{k}\).

\section*{Plot graph of the function \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}-2\).}

\section*{Solution}

\section*{Step 1:}

Plot the graph of the function \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}\)

\section*{Step 2:}

Shift the graph of \(y=e^{x}\) by 2 units downwards to plot the graph of \(y=e^{x}-2\)

\section*{Horizontal stretch}

Let us consider a function \(\mathrm{y}=\mathrm{f}(\mathrm{x})\). When the points on the X -axis of the graph of the given function \(f(x)\) are divided by \(k\) units, it gives the graph of \(y=f(k x) ; k>1\)

Plot graph of the function \(\mathrm{y}=\sin 3 \mathrm{x}\).

\section*{Solution}

To get the graph of \(y=\sin 3 x\), the points on the \(X\)-axis of the graph of the given function \(f(x)\) are divided by 3 units.
Here, the period of \(\sin 3 x\) is \(\frac{2 \pi}{3}\).

Let us consider a function \(\mathrm{y}=\mathrm{f}(\mathrm{x})\). When the points on the X -axis of the graph of the given function \(f(x)\) are multiplied by \(k\) units, it gives the graph of \(y=f\left(\frac{x}{k}\right) ; k>1\)
\[
y=f(x)
\]
\[
y=f\left(\frac{x}{k}\right)
\]

Plot graph of the function \(y=\cos \left(\frac{x}{2}\right)\).

\section*{Solution}

To get the graph of
\(y=\cos \left(\frac{x}{2}\right)\), the points on the X -axis of the graph of the given function \(\mathrm{f}(\mathrm{x})\) are multiplied by 2 .
Here, the period of \(\cos \left(\frac{x}{2}\right)\) is \(4 \pi\).

\section*{Vertical stretch}

Let us consider a function \(\mathrm{y}=\mathrm{f}(\mathrm{x})\)

When the points on the Y-axis of the graph of the given function \(f(x)\) are multiplied by \(k\) units, it gives the graph of \(\mathrm{y}=\mathrm{kf}(\mathrm{x})\); \(\mathrm{k}>1\)

When the points on the Y-axis of the graph of the given function \(f(x)\) are divided by \(k\) units, it gives the graph of \(y=\frac{f(x)}{k} ; k>1\)

Plot graph of the function \(y=3[x]\); where [.] denotes G.I.F.

\section*{Solution}

\section*{Step 1:}

Plot the graph of the function \(\mathrm{y}=[\mathrm{x}]\)

\section*{Step 2:}

Multiply the points on the Y-axis of the graph by 3 units to get the graph of \(y=3[x]\)

Plot graph of the function \(\mathrm{y}=\left|\sin \mathrm{x}+\frac{1}{2}\right|\).

\section*{Solution}

\section*{Step 1:}

Plot the graph of the function \(\mathrm{y}=\sin \mathrm{x}\)

\section*{Step 3:}

To plot \(\mathrm{y}=\left|\sin \mathrm{x}+\frac{1}{2}\right|\), take the mirror image of \(y=\sin x+\frac{1}{2}\) about the X-axis of that part of the graph which lies below the X -axis.

\section*{Step 2:}

Shift the graph of \(y=\sin x\) by \(\frac{1}{2}\) units upwards to plot the graph of \(y=\sin x+\frac{1}{2}\)

Find the number of solutions of the equation \(|x|=\cos x\).

\section*{Solution}

\section*{Step 1:}

Given, \(|\mathrm{x}|=\cos \mathrm{x}\)
Number of real solutions = Number of points of intersection of the curves
Let us plot \(\mathrm{y}=|\mathrm{x}|\) and \(\mathrm{y}=\cos \mathrm{x}\)

\section*{Step 2:}

Clearly, both the graphs intersect at two points.
Therefore, there are two solutions for \(|x|=\cos x\)

Plot the graph of the function \(y=|2-|x-1||\)

\section*{Solution}

\section*{Step 1:}

Plot \(y=|x|\)

\section*{Step 3:}

To plot \(\mathrm{y}=-|\mathrm{x}-1|\), take the reflection of \(y=|x-1|\) about the \(X\)-axis.

\section*{Step 2:}

Shift the graph of \(y=|x|\) towards the right by 1 unit to obtain the graph of \(y=|x-1|\)

\section*{Step 4:}

To plot \(y=2-|x-1|\), shift the graph of \(y=-|x-1|\) by 2 units in the upward direction.

\section*{Step 5:}

To plot \(y=|2-|x-1||\), take the mirror image of \(y=2-|x-1|\) about the \(X\)-axis of that part of the graph which lies below the X -axis.

\section*{Concept Check}
1. For \(\mathrm{x} \in \mathbb{R}-\{0\}\), the function \(\mathrm{f}(\mathrm{x})\) satisfies \(\mathrm{f}(\mathrm{x})+2 \mathrm{f}(1-\mathrm{x})=\frac{1}{\mathrm{x}}\). Find the value of \(\mathrm{f}(2)\).
(a) \(-\frac{5}{6}\)
(b) \(\frac{1}{2}\)
(c) -2
(d) \(\frac{3}{4}\)
2. A function \(f(x)\) is given by \(f(x)=\frac{5^{x}}{5^{x}+5}\).

Find the sum of the series \(\mathrm{f}\left(\frac{1}{20}\right)+\mathrm{f}\left(\frac{2}{20}\right)+\mathrm{f}\left(\frac{3}{20}\right)+\ldots \ldots . . . . .+\mathrm{f}\left(\frac{39}{20}\right)\).
(a) \(\frac{19}{2}\)
(b) \(\frac{49}{2}\)
(c) \(\frac{39}{2}\)
(d) \(\frac{29}{2}\)
3. Plot the graph of of \(y=\ln (x+2)\)
4. Plot the graph of the function \(y=\sin x+3\)
5. Plot the graph of the function \(y=\frac{|x|}{5}\)
6. Plot the graph of the function \(\mathrm{y}=2 \sin 2 \mathrm{x}\)

\section*{Summary Sheet}

\section*{Key Takeaways}
- \(f(x+y)=f(x)+f(y) \Rightarrow f(x)=k x ; k \in \mathbb{R}\)
- \(\mathrm{f}(\mathrm{x}+\mathrm{y})=\mathrm{f}(\mathrm{x}) \mathrm{f}(\mathrm{y}) \Rightarrow \mathrm{f}(\mathrm{x})=\mathrm{a}^{\mathrm{kx}} ; \mathrm{k} \in \mathbb{R}\) and \(\mathrm{a}>0\)
- \(f(x y)=f(x)+f(y) \Rightarrow f(x)=k \log _{a} x ; k \in \mathbb{R}, a>0\), and \(a \neq 1\)
- \(f(x y)=f(x) f(y) \Rightarrow f(x)=x^{n} ; n \in \mathbb{R}\)
- If \(f(x)\) is a polynomial of degree \(n\) such that, \(f(x) f\left(\frac{1}{x}\right)=f(x)+f\left(\frac{1}{x}\right) \Rightarrow f(x)=1 \pm x^{n} ; n \in \mathbb{R}\)

\section*{Condition}
- \(f(x)\) is shifted by \(k\) units towards the left
- \(\mathrm{f}(\mathrm{x})\) is shifted by k units towards the right
- \(f(x)\) is shifted by \(k\) units upwards
- \(f(x)\) is shifted by \(k\) units downwards
- When the points on the X -axis of the graph of the given function \(f(x)\) are divided by k units
- When the points on the \(Y\)-axis of the graph of the given function \(f(x)\) are divided by k units
- When the points on the Y-axis of the graph of the given function \(f(x)\) are multiplied by k units

\section*{Function}
\[
y=f(x+k)
\]
\[
y=f(x-k)
\]
\[
y=f(x)+k ; k>0
\]
\[
y=f(x)-k ; k>0
\]
\[
y=f(k x) ; k>1
\]
\[
y=f\left(\frac{x}{k}\right) ; k>1
\]
\[
y=k f(x) ; k>0
\]

Transformation of graphs

\section*{Self-Assessment}

Find the number of solutions for the following function: \(\sin \mathrm{x}=\mathrm{x}^{2}+\mathrm{x}+1, \mathrm{x} \in \mathbb{R}\)

\section*{Concept Check}
1.

Given,
\(f(x)+2 f(1-x)=\frac{1}{x} \ldots(i)\)
By substituting \(x=2\) in equation (i), we get, \(\mathrm{f}(2)+2 \mathrm{f}(-1)=\frac{1}{2} \ldots(\mathrm{ii})\)
By substituting \(x=-1\) in equation (i), we get, \(\mathrm{f}(-1)+2 \mathrm{f}(2)=-1 \ldots(\mathrm{iii})\)

Here, we have two unknowns, \(f(2)\) and \(f(-1)\), and two equations (ii) and (iii).
By solving equations (ii) and (iii), we get,
\(f(2)=-\frac{5}{6}\)
\(\therefore\) Option (a) is the correct answer.
2.

\section*{Step 1:}
\(f(x)=\frac{5^{x}}{5^{x}+5}\)
\(\mathrm{f}(2-\mathrm{x})=\frac{5^{2-\mathrm{x}}}{5^{2-x}+5}=\frac{5}{5^{x}+5}\).

\section*{Step 2:}

Adding (i) and (ii), we get,
\(f(x)+f(2-x)=\frac{5^{x}}{5^{x}+5}+\frac{5}{5^{x}+5}=1\)
\(\mathrm{f}\left(\frac{1}{20}\right)+\mathrm{f}\left(\frac{39}{20}\right)=1\)
\(\mathrm{f}\left(\frac{2}{20}\right)+\mathrm{f}\left(\frac{38}{20}\right)=1\)
\(\mathrm{f}\left(\frac{19}{20}\right)+\mathrm{f}\left(\frac{21}{20}\right)=1\)

\section*{Step 3:}
\(\mathrm{f}\left(\frac{1}{20}\right)+\mathrm{f}\left(\frac{2}{20}\right)+\mathrm{f}\left(\frac{3}{20}\right)+\ldots \ldots \ldots+\mathrm{f}\left(\frac{39}{20}\right)\)
\(=f\left(\frac{1}{20}\right)+f\left(\frac{39}{20}\right)+f\left(\frac{2}{20}\right)+f\left(\frac{38}{20}\right)+\ldots \ldots . .+f\left(\frac{19}{20}\right)\) \(+\mathrm{f}\left(\frac{21}{20}\right)+\mathrm{f}\left(\frac{20}{20}\right)\)
\(=1+1+\ldots . . . . .(19\) times \()+f(1)\)
\(=19+\frac{1}{2} \quad\left(\because \mathrm{f}(\mathrm{x})=\frac{5^{\mathrm{x}}}{5^{\mathrm{x}}+5}\right)\)
\(=\frac{39}{2}\)

\section*{So, option (c) is the correct answer.}
3.

Let us plot the graph of \(y=\ln x\)

To plot \(y=\ln (x+2)\), shift the graph of \(y=\ln x\) leftwards by 2 units.

4.

Let us plot the graph of \(\mathrm{y}=\sin \mathrm{x}\)

5.

Let us plot the graph of \(y=|x|\)

The whole graph of \(y=\sin x\) is shifted upwards by 3 units to get the graph of \(y=\sin x+3\)

Divide the points on the Y-axis of the graph by 5 to get the graph of \(y=\frac{|x|}{5}\)

6.

\section*{Step 1:}

Plot the graph of the function \(y=\sin x\)

\section*{Step 2:}

Divide the points on the X-axis of the graph by 2 to get the graph of \(y=\sin 2 x\)

\section*{Step 3:}

Multiply the points on the Y-axis of the graph by 2 to get the graph of \(y=2 \sin 2 x\)

\section*{Self-Assessment}

Plot the graph of \(y=f(x)=\sin x, y=g(x)=x^{2}+x+1=\left(x+\frac{1}{2}\right)^{2}+\frac{3}{4}\)

From the graph, we can observe that the number of points of intersection is zero. Hence, \(\sin x=x^{2}+x+1\) has no solution.

\section*{MORE ON TRANSFORMATION OF GRAPHS}

\section*{What you already know}

\section*{What you will learn}
- Different transformations of graphs
- Number of solutions of an equation using graphs

\section*{Transformation of Graphs}

\section*{\(\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{f}(-\mathrm{x})\) (Mirror image about the Y-axis)}

Let us consider the example of the following function: \(f(x)=e^{x}\)

We can obtain the graph of \(f(-x)=e^{-x}\) by taking the mirror image about the Y-axis.

From the given example, we can deduce that for \(f(x)=a^{x}, a>0\), the mirror image about the \(Y\)-axis becomes \(\mathrm{f}(-\mathrm{x})=\mathrm{a}^{-\mathrm{x}}, \forall \mathrm{x}\) in the domain.

Now, let us consider any random quadratic function graph of \(y=f(x)\) like the following:

Similarly, the graph of \(y=f(-x)\) can be obtained by taking the mirror image about the Y-axis.

From the given example, we can deduce that for any random quadratic equation \(f(x)\), the graph of \(\mathrm{f}(-\mathrm{x})\) is obtained by taking the reflection about the Y-axis.

\section*{Plot the graph of \(y=\log (-x)\) when the graph of \(y=\log x\) is given.}

\section*{Solution}

Given: Graph of \(\mathrm{y}=\log \mathrm{x}\)

The graph of \(y=\log (-x)\) is obtained by taking the reflection about \(Y\)-axis

\section*{\(f(x) \rightarrow-f(x)\) (Mirror image about the \(X\)-axis)}

Consider the following graph for \(\mathrm{y}=\mathrm{f}(\mathrm{x})\) :

We can obtain the graph of \(y=-f(x)\) by taking the mirror image about the \(X\)-axis.

From the given example, we can deduce that the points where the graph intersects the X -axis do not change (invariant points). The graph of \(y=-f(x)\) can be obtained by multiplying the values of \(f(x)\) by \(-1 \forall x\) in the domain.

Plot the graph of \(\mathrm{y}=-\mathrm{e}^{\mathrm{x}}\) when the graph of \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}\) is given.

\section*{Solution}

Given: Graph of \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}\)

The graph of \(\mathrm{y}=-\mathrm{e}^{\mathrm{x}}\) is obtained by taking the reflection about X-axis

\section*{\(f(x) \rightarrow-f(-x)\)}

Consider the following graph for \(\mathrm{f}(\mathrm{x})\) :

(2) \(f(-x) \rightarrow-f(-x)\)

So, it means that take the mirror image of the graph about the Y-axis and then about the X-axis.

Plot the graph of \(y=-e^{-x}\) when the graph of \(y=e^{x}\) is given.

\section*{Solution}

Given: Graph of \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}\)

The required graph can be obtained by taking the mirror image about the Y -axis and then about the X -axis

\section*{\(\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{f}(|\mathrm{x}|)\) (Horizontal flip)}

Consider the following graph for \(\mathrm{f}(\mathrm{x})\) :

We can obtain the graph of \(f(|x|)\) by the following ways:
1. Retaining the graph corresponding to only the non-negative values of \(x\)
2. Taking the mirror image of the retained graph about the Y-axis

\(f(|x|)\) is an even function as \(f(x)=f(-x)\), i.e., the graph of \(f(|x|)\) is symmetric about the \(Y\)-axis.

\section*{Plot the graph of \(y=\log |x|\) when the graph of \(y=\log x\) is given.}

\section*{Solution}

Since there is no portion in the graph of \(y=\log x\) which corresponds to negative value of \(x\), hence the entire graph is retained and the graph of \(y=\log x\) is obtained by simply taking mirror image about the Y-axis

\section*{\(\mathrm{f}(\mathrm{x}) \rightarrow|\mathrm{f}(\mathrm{x})|\) (Vertical flip)}

Consider the following graph for \(\mathrm{f}(\mathrm{x})\) :

2. Flipping the graph corresponding to the negative values of \(y\) about the \(X\)-axis

We can obtain the graph of \(|f(x)|\) by the following ways:
1. Retaining the graph that is above the X -axis

\section*{Plot the graph of \(y=|x|\) when the graph of \(y=x\) is given.}

\section*{Solution}
 of \(y=x\) above the X-axis and flip the graph corresponding to the negative values of \(y\) about the \(X\)-axis.

\section*{\(f(x) \rightarrow|f(|x|)|\)}

Consider the following graph for \(\mathrm{f}(\mathrm{x})\) :

2. Now, carry out the transformation \(\mathrm{f}(|\mathrm{x}|) \rightarrow|\mathrm{f}(|\mathrm{x}|)|\) with reference to the graph of \(y=f(|x|)\) obtained in the above step

We can obtain the graph of \(|f(|x|)|\) in the following steps:
(1) The first step is to carry out the transformation \(\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{f}(|\mathrm{x}|)\) with reference to the graph of \(y=f(x)\)

\[
y=|f(|x|)|
\]

1. \(|f(|x|)|\) is an even function as the graph of \(|f(|x|)|\) is symmetric about the Y-axis.
2. Carrying out the transformations \(\mathrm{f}(\mathrm{x}) \rightarrow|\mathrm{f}(\mathrm{x})|\) and \(|\mathrm{f}(\mathrm{x})| \rightarrow|\mathrm{f}(|\mathrm{x}|)|\) will give the same result.

\section*{Solution}

\section*{Step 1:}

With respect to the graph of \(\mathrm{y}=\log \mathrm{x}\) carry out the transformation \(\log x \rightarrow \log (|x|)\)

Step 2: \(\mathrm{y}=|\log (|\mathrm{x}|)|\)

\section*{\(|y|=f(x)\)}

Consider the following graph for \(\mathrm{y}=\mathrm{f}(\mathrm{x})\) :

1. For \(|y|=f(x)\), the region below the X-axis cannot be considered as \(|y|\) gives the non-negative values.

2. \(A s|y|=f(x) \Rightarrow y=f(x)\) and \(-y=f(x)\), we also consider the mirror image of the given graph about the X -axis.

Hence, graph of \(|y|=f(x)\) is obtained.

Draw the graph of \(|y|=(x-1)(x-2)\)

\section*{Solution}

\section*{Step 1:}

The region below the \(y\) axis of \(|y|=(x-1)(x-2)\) is not to be considered as \(|y|\) gives non-negative values.

\section*{Step 2:}

Now take the mirror image of the above graph about the X-axis

Hence, the graph of \(|y|=(x-1)(x-2)\) is obtained as above.

\section*{Draw the graphs of \(|f(x)|, f(|x|),|f(|x|)|\) for the given function \(f(x)\).}

\section*{Solution}
\(y=|f(x)|\)

\section*{Finding the number of solutions}

To find the number of solutions for \(f(x)=g(x)\), try to plot the graphs of both the functions and look for the number of points of intersection, i.e., plot \(y=f(x), y=g(x)\) in the same XY-plane within their respective domains, and identify the points where these functions intersect.

Find the number of solutions for the following function:
\(|\ln \mathrm{x}|=2^{-\mathrm{x}}\)

\section*{Solution}

\section*{Step 1:}

Plot the graph of the function: \(y=|\ln x|\)

\section*{Step 2:}

Plot the graph of the function:
\(y=2^{-x}\)

\section*{Step 3:}

Combine both the graphs.

From the graph, we can observe that the number of solutions for \(|\ln x|=2^{-x}\) are two.

\section*{\(f(x) \rightarrow[f(x)],[\).\(] denotes the GIF function\)}

Consider \(\mathrm{y}=[\sin \mathrm{x}], \mathrm{x} \in[0,2 \pi]\)

\section*{Explanation:}

We know that \([\mathrm{x}]=\mathrm{x}\) for \(\mathrm{x} \in \mathbb{Z}\)
Hence,
\([\sin x]=0\) for \(x\left[0, \frac{\pi}{2}\right.\) )
\([\sin x]=1\) for \(x=\frac{\pi}{2}\)
\([\sin x]=0\) for \(x \in\left(\frac{\pi}{2}, \pi\right]\)
\([\sin x]=-1\) for \(x \in(\pi, 2 \pi)\)
\([\sin x]=0\) for \(x=2 \pi\)
Hence, the graph of \(y=[\sin x]\) for \(x \in[0,2 \pi]\) is as follows:

As \(\sin x\) has a period of \(2 \pi\), the period of [ \(\sin x]\) remains \(2 \pi\). Hence, the graph would repeat after every \(2 \pi\) interval.

\section*{\(\mathrm{f}(\mathrm{x}) \rightarrow(\mathrm{f}\{\mathrm{x}\})\)}

Consider \(\mathrm{y}=\mathrm{e}^{[x]}, \mathrm{x} \in(-\infty, \infty)\)

\section*{Explanation:}

For \(\mathrm{y}=\mathrm{e}^{\mathrm{x}}\), the graph is given as follows:

We know the following:
\(\{x\} \in[0,1) \Rightarrow e^{[x\}} \in[1, e)\)
As \(\{x\}\) is a periodic function with period \(1, \mathrm{e}^{[x\}}\) is also a periodic function with the same period.

Find the number of solutions for \(|\mathbf{x}|=\operatorname{sgn}\{\mathbf{x}\}\), where \(\{\).\(\} denotes a fractional part function.\)

\section*{Solution}

Plot the graphs of \(y=|x|\) and \(y=\operatorname{sgn}\{x\}\) simultaneously.

From the graph, we can observe that both the functions intersect only at origin. Hence, the number of required solutions is one.

Find the number of solutions of the equation \(\cos x=\frac{x}{8}\)

Solution
Step 1: Plot \(\mathrm{y}=\cos \mathrm{x}\)

Step 2: Plot \(y=\frac{x}{8}\) in the same graph and hence obtain the points of intersection

From the graph, we can observe that the number of solutions is five

\section*{Concept Check}
1. Find the number of solutions for the following: \(|y|=\cos x\) and \(y=-x^{2}\)
2. Find the number of solutions for the following: \(|[\mathrm{x}]|=|\mathrm{x}-1|\)

\section*{Summary Sheet}

\section*{Key Takeaways}
- \(\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{f}(-\mathrm{x})\) is obtained by taking a mirror image of the graph about the Y -axis.
- \(\mathrm{f}(\mathrm{x}) \rightarrow-\mathrm{f}(\mathrm{x})\) is obtained by taking a mirror image of the graph about the X-axis.
- \(\mathrm{f}(\mathrm{x}) \rightarrow-\mathrm{f}(-\mathrm{x})\) can be obtained by taking a mirror image of the graph about the Y -axis and then about the X -axis or vice versa.
- \(\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{f}(|\mathrm{x}|)\) can be obtained by retaining the graph corresponding to the non-negative values of \(x\) and taking the mirror image of it about the \(Y\)-axis.
- \(\mathrm{f}(\mathrm{x}) \rightarrow|\mathrm{f}(\mathrm{x})|\) can be obtained by retaining the graph above the X-axis and flip the graph corresponding to the negative values of \(y\) about the \(X\)-axis.
- \(\mathrm{f}(\mathrm{x}) \rightarrow|\mathrm{f}(|\mathrm{x}|)|\) can be obtained in the following two steps:
(1) \(f(x) \rightarrow|f(x)|\)
(2) \(|f(x)| \rightarrow|f(|x|)|\)

It can also be obtained as follows:
(1) \(f(x) \rightarrow f(|x|)\)
(2) \(f(|x|) \rightarrow|f(|x|)|\).
- To find the number of solutions for \(f(x)=g(x)\), plot the graphs of both the functions and look for the number of points of intersection.

\section*{Mind Map}

\section*{Self-Assessment}

Find the number of solutions for the following function: \(\frac{-3}{4} x^{2}+3 x+1=2^{x}\)

\section*{Concept Check}
1.

\section*{Step 1:}

Plot the graph of the function:
\(|y|=\cos x\)

\section*{Step 2:}

Plotting the graph of \(y=-x^{2}\) and obtaining the number of solutions by counting the number of points of intersection

From the graph, we can observe that the number of solutions is two.
2.

\section*{Step 1:}

Plotting the graph of the function \(y=|[x]|\)

\section*{Step 2:}

Plot the graph of the function:
\[
y=|x-1|
\]

\section*{Step 3:}

Plotting both the graphs.

From the graph, we can observe that the number of solutions for \(|[x]|=|x-1|\) is zero.

\section*{Self-Assessment}

Plot the graph for the following:
\(y=f(x)=\frac{-3}{4} x^{2}+3 x+1\) and \(y=g(x)=2^{x}\)

We can observe that the number of points of intersection for both the graphs is two.
Hence, \(\frac{-3}{4} x^{2}+3 x+1=2^{x}\) has two solutions.```
