Quadratic Equation

1. Standard Form of Quadratic Equations
2. Zeros, Roots and Solutions
3. Methods to Solve
4. Nature of Roots

Important Terms

$ax^2 + bx + c = 0$

Degree

(An arrow points from the word "Degree" in a green box to the exponent 2 in the equation above.)

a , b , and c are real numbers and $a \neq 0$

Zeros

Zeros of
quadratic
polynomial
 $P(x)$

$$P(x) = (x-2)(x-2)$$
$$x = 2 \text{ \& } 2$$

Roots

Roots of
quadratic
equation

$$(x-2)(x-2) = 0$$
$$x = 2 \text{ \& } 2$$

Solution

The values of the
unknown
variable x ,
which satisfy the
equation.

$$(x-2)(x-2) = 0$$
$$x = 2$$

Methods to Solve Quadratic Equations

Factorization

Quadratic
Formula

01

02

03

04

05

06

07

Factorization

1. Split the middle term.

Product of split terms
 $= (a \times c)$

2. Factorize the equation

3. Equate each factor to 0

General form:

$$ax^2 + bx + c = 0.$$

Eg: $9x^2 - 3x - 2 = 0.$

$$9x^2 - 6x + 3x - 2 = 0.$$

$$3x(3x - 2) + 1(3x - 2) = 0.$$

$$(3x - 2)(3x + 1) = 0$$

$$x = \frac{2}{3} \text{ or } x = -\frac{1}{3}.$$

Quadratic Formula

$$ax^2 + bx + c = 0$$

$$\text{Root } x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

i.e.,

$$x = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

where, $b^2 - 4ac \geq 0$

The quadratic formula is used where the factorization method is difficult to apply.

Nature Of Roots

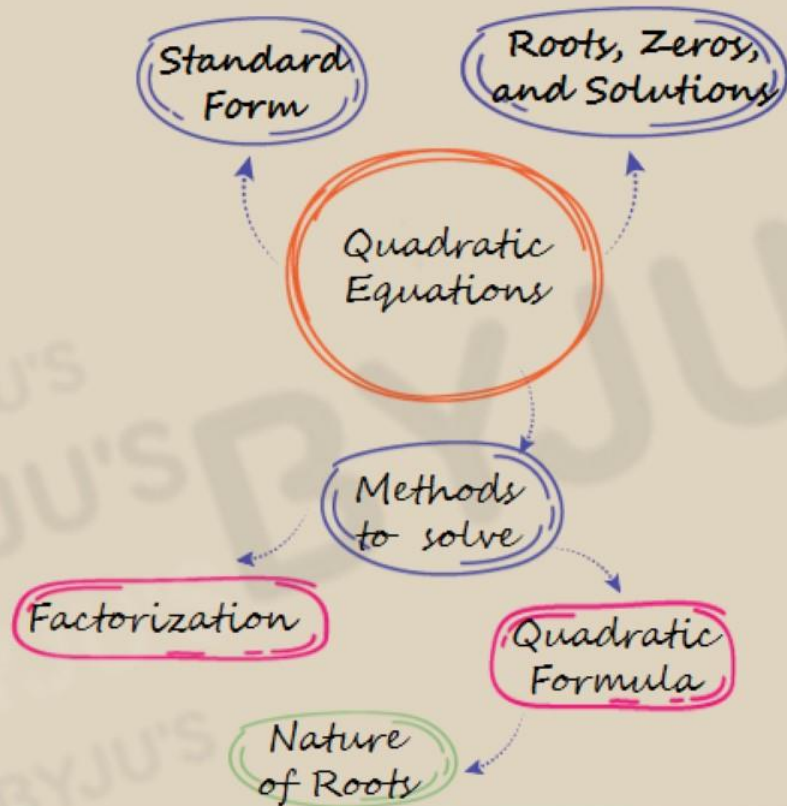

$$ax^2 + bx + c = 0$$

$$\text{Discriminant (D)} = b^2 - 4ac$$

Nature of Roots

$b^2 - 4ac > 0$ $b^2 - 4ac = 0$ $b^2 - 4ac < 0$

Type of Roots	Real & Distinct Roots	Real & Equal Roots	No Real Roots
Value of Roots	$= \frac{-b \pm \sqrt{D}}{2a}$	$= \frac{-b}{2a}, \frac{-b}{2a}$	Not Valid

Arithmetic progression

1. Arithmetic progression

2. General form of an AP

3. n^{th} Term of an AP

4. Sum of first n terms of an AP

Arithmetic progression

An arithmetic progression is a sequence of numbers in which each term is obtained by adding a fixed number to the preceding term, except the first term.

Example

Common difference

(The difference between consecutive terms in an AP is a fixed number, d)

General Form of an AP

A sequence of the form

$a, a + d, a + 2d, a + 3d, a + 4d$ and so on,

Where a is the first term and d is a common difference.

n^{th} Term of an AP

$$a_n = \{a + (n - 1)d\}$$

where a_n is the n^{th} term,

a is the first term,

d is the common difference and

n is the number of terms in the sequence.

Sum of First n Terms in an AP

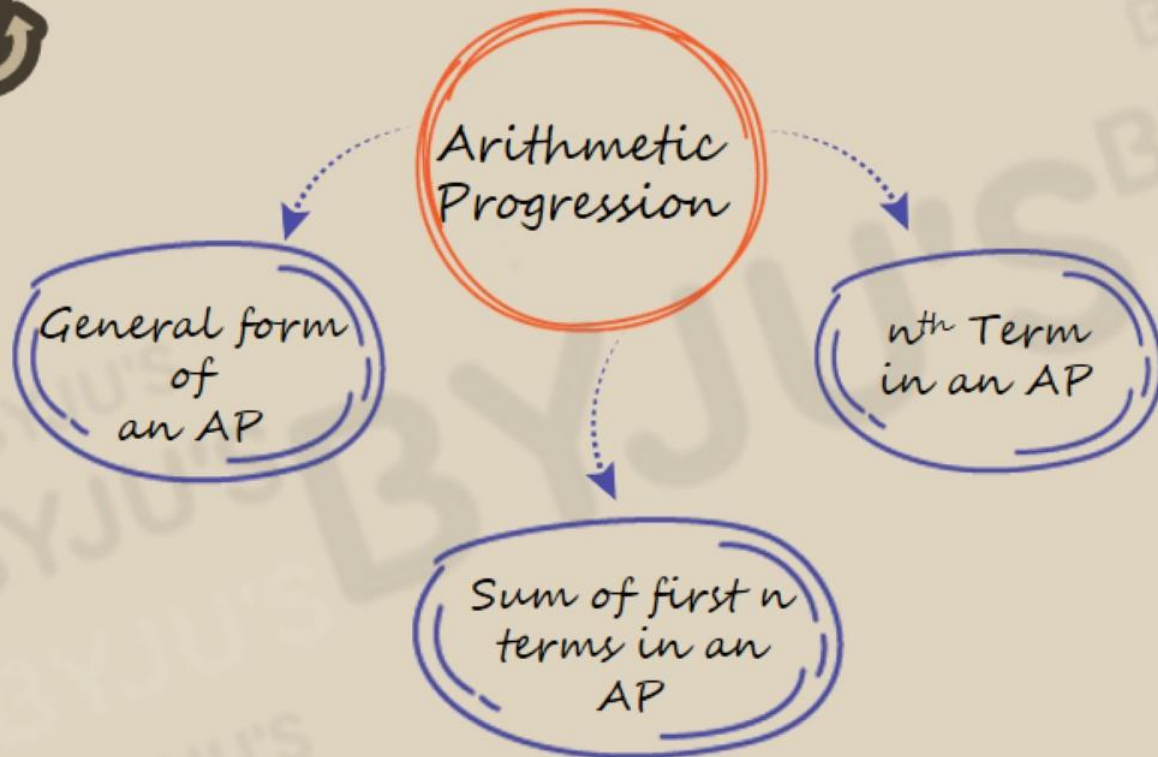

$$S_n = \frac{n}{2} \{2a + (n - 1)d\}$$

When first term (a) and common difference (d) are known

$$S_n = \frac{n}{2} (a + l)$$

When first term (a) and last term (l) are known

where n is the number of terms in the sequence and S_n is the sum of first n terms

Circle

1. Basic Terminologies

2. Theorem 1

3. Theorem 2

Basic Terminologies

Sector

The region between an arc and the two radii

Major sector

Minor sector

Segment

The region between a chord and the arc

Major segment

Minor segment

Tangent

Line touching the circle at only one point

Theorem 1

The tangent at any point of a circle is perpendicular to the radius through the point of contact.

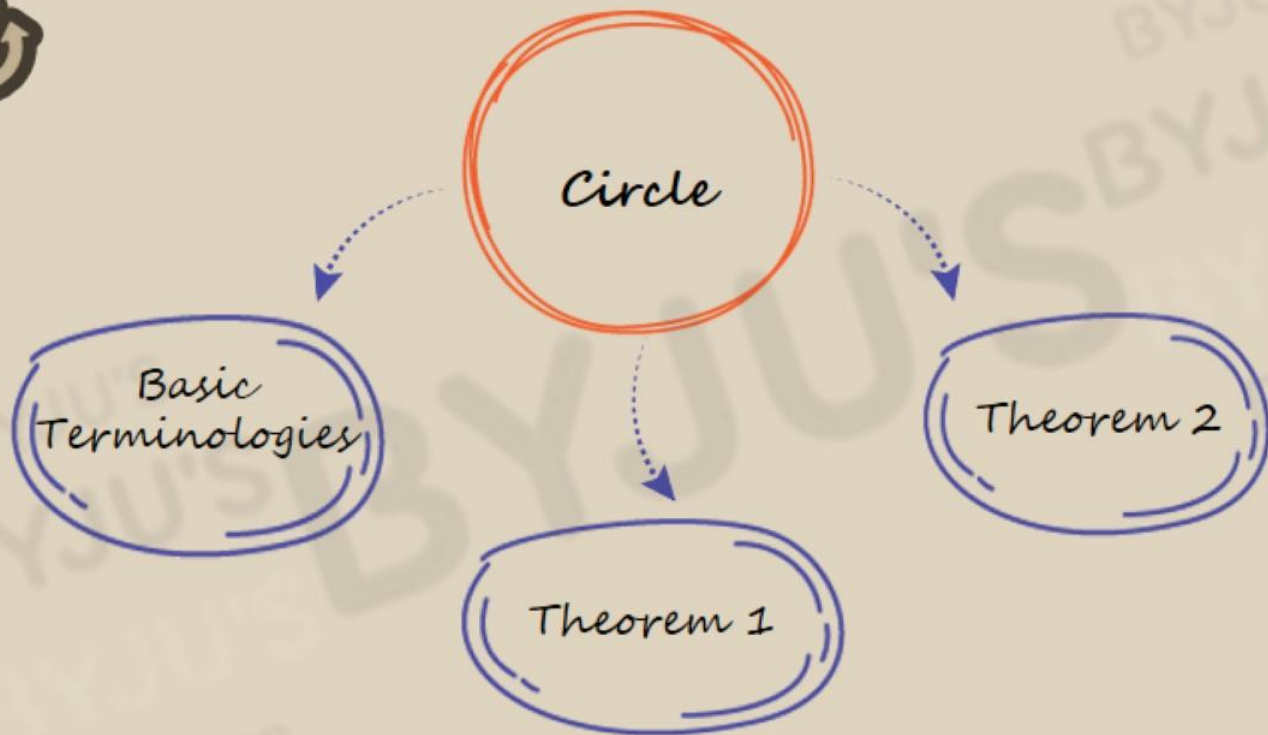

Theorem 2

The lengths of tangents drawn from an external point to a circle are equal.

Construction

1. Division of a line segment in a given ratio

2. Construction of pair of tangents

Division of a line segment in the given ratio

Example

Let's divide a line segment of length 16 cm in the ratio 5:3.

Step 1: Draw $AB = 16$ cm

Step 2: Draw a ray AX making an acute angle with AB .

Step 3: Locate 8 ($= 5 + 3$) points on ray AX such that,

$$AA_1 = A_1A_2 = A_2A_3 = A_3A_4 = \dots = A_7A_8$$

Step 4: Join BA_8

Step 5: Draw a line parallel to BA_8 from point A_5 (by making an angle equal to $\angle AA_8B$) intersecting AB at point C .

Construction of Pair of Tangents

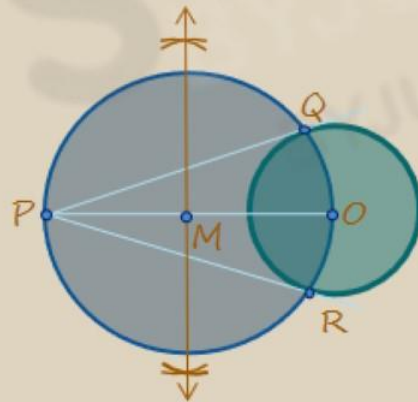

Example

To construct the tangents to a circle from a point P outside it.

Step 1: Join PO and draw a perpendicular bisector of PO to locate its midpoint. Let's say M is the midpoint of PO .

Step 2: Taking M as a centre and MO (or MP) as radius, draw a circle. Let it intersect the given circle at the points Q and R .

Step 3: Join PQ and PR .

Construction

Division of a
line segment in
a given ratio

Construction of
pair of tangents to
a circle.

SOME
APPLICATIONS
OF
TRIGONOMETRY

Some Applications of Trigonometry

1. Basic Terminologies

2. Assumptions made while solving

3. Trigonometric Ratios of Some Common Angles

Basic Terminologies

If the object to be viewed is straight ahead, then the *line of sight* is the same as the *horizontal level*.

Line of Sight

The line drawn from the eyes of an observer to a point on the object viewed.

Basic Terminologies

Angle of Elevation

The angle formed by the line of sight with the horizontal when the point being viewed is above the horizontal level.

Basic Terminologies

Look Below

Angle of Depression

The angle formed by the line of sight with the horizontal when the point being viewed is below the horizontal level.

Assumptions made while solving

Example

The angle of elevation of the top of the Qutub Minar, 73 m away from its base is 45° .

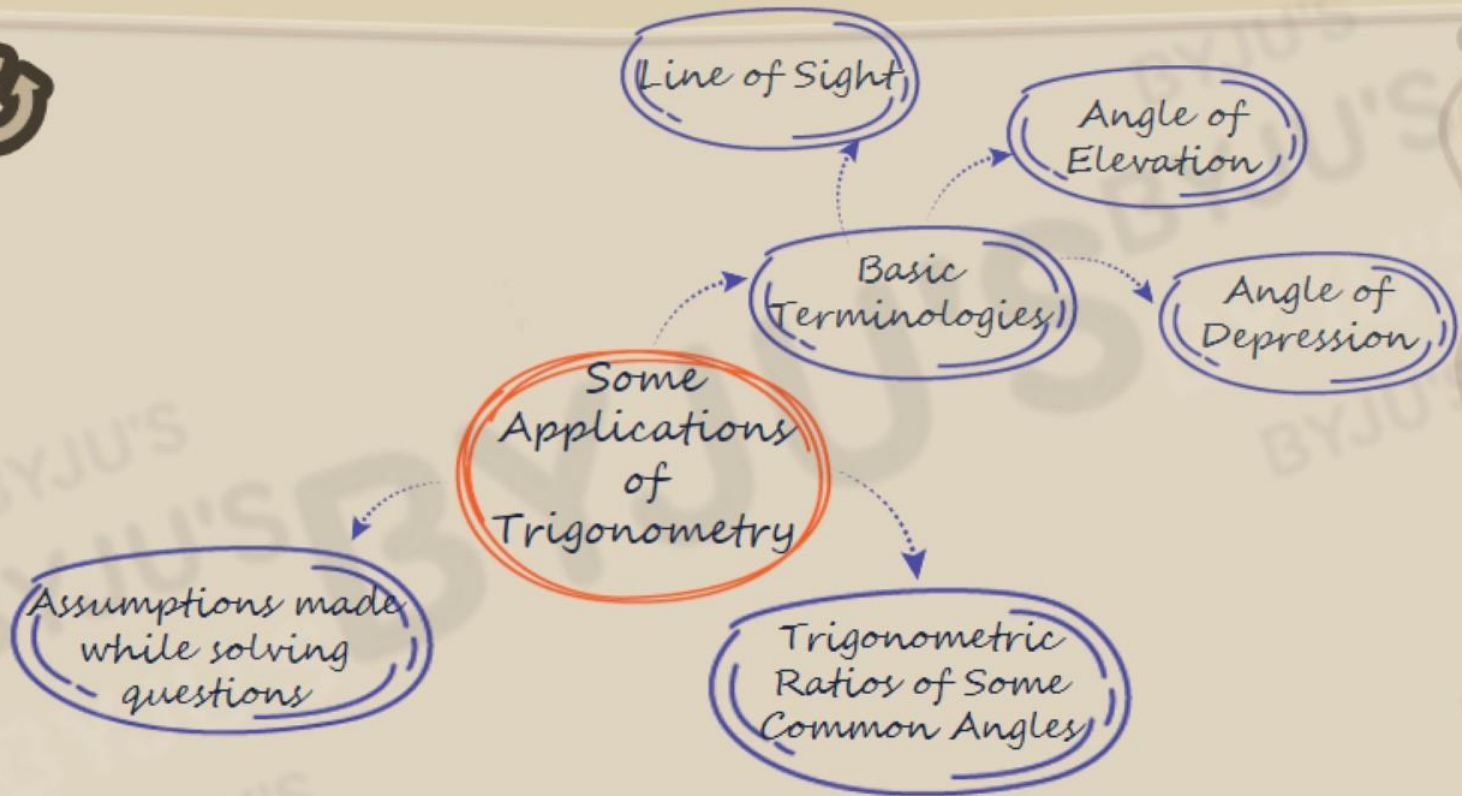

Steps to Draw the figure:

- 1, Represent the 3D object by a vertical line.
2. Represent the observer as a point object.
3. Label the angle, height and distance

Trigonometric Ratios of Some Common Angles

		Angle θ				
		0°	30°	45°	60°	90°
Ratio	$\sin \theta$	0	$\frac{1}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{3}}{2}$	1
	$\cos \theta$	1	$\frac{\sqrt{3}}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{1}{2}$	0
	$\tan \theta$	0	$\frac{1}{\sqrt{3}}$	1	$\sqrt{3}$	Not defined
	$\operatorname{cosec} \theta$	Not defined	2	$\sqrt{2}$	$\frac{2}{\sqrt{3}}$	1
	$\sec \theta$	1	$\frac{2}{\sqrt{3}}$	$\sqrt{2}$	2	Not defined
	$\cot \theta$	Not defined	$\sqrt{3}$	1	$\frac{1}{\sqrt{3}}$	0

SURFACE
AREAS
AND
VOLUMES

Surface Areas and Volumes

1. Formulae of Solids
2. Combination of Solids
3. Surface Area of Combined Solids
4. Volume of Combined Solids
5. Conversion of Solids

Formulae of Solids

Cube

$4a^2$: Lateral surface area

$6a^2$: Total surface area

a^3 : Volume

Cuboid

Lateral surface area : $2h(l + b)$

Total surface area : $2(lb + bh + hl)$

Volume : lbh

Formulae of Solids

Cylinder

$2\pi rh$: Curved surface area

$2\pi rh + 2\pi r^2$: Total surface area

$\pi r^2 h$: Volume

Sphere

Curved surface area: $4\pi r^2$

Volume: $\frac{4}{3}\pi r^3$

Formulae of Solids

Curved surface area :

$$2\pi r^2$$

Total surface area :

$$3\pi r^2$$

Volume :

$$\frac{2}{3}\pi r^3$$

Hemisphere

Cone

$\pi r l$: Curved surface area

$\pi r l + \pi r^2$: Total surface area

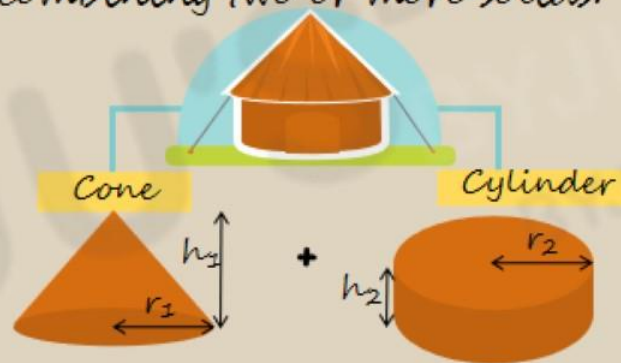

$\frac{1}{3}\pi r^2 h$: Volume

Combination of solids

Example

Shapes that are formed by combining two or more solids.

Conversion of solids

Example

When a solid is reshaped, its volume remains the same.

Sum of volumes of
smaller spheres

=

Volume of the larger
sphere

=

Volume of
the cube

STATISTICS

Statistics

1. Mean of Grouped Data

2. Median of Grouped Data

3. Mode of Grouped Data

Mean of Grouped Data

Mean is a measure of central tendency which gives the average of data.

Mean

Direct Method

$$\bar{x} = \frac{\sum f_i x_i}{\sum f_i}$$

$$\text{Class mark } (x_i) = \frac{\text{Upper} + \text{Lower Class Limit}}{2}$$

Assumed Mean Method

An arbitrary mean 'a' is chosen which is called 'assumed mean', somewhere in the middle of all the values of x.

$$\bar{x} = a + \frac{\sum f_i d_i}{\sum f_i} \quad \text{Where } d_i = (x_i - a)$$

Median of Grouped Data

The median of a set of data is the middlemost number or center value in the set.

$$\text{Median} = l + \left(\frac{\frac{n}{2} - cf}{f} \right) \times h$$

l = Lower limit of median class

n = Number of observations

f = Frequency of median class

cf = Cumulative frequency of preceding class

h = Class size

Mode of Grouped Data

The mode is the value that is repeatedly occurring in a given set.

$$\text{Mode} = l + \left(\frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h$$

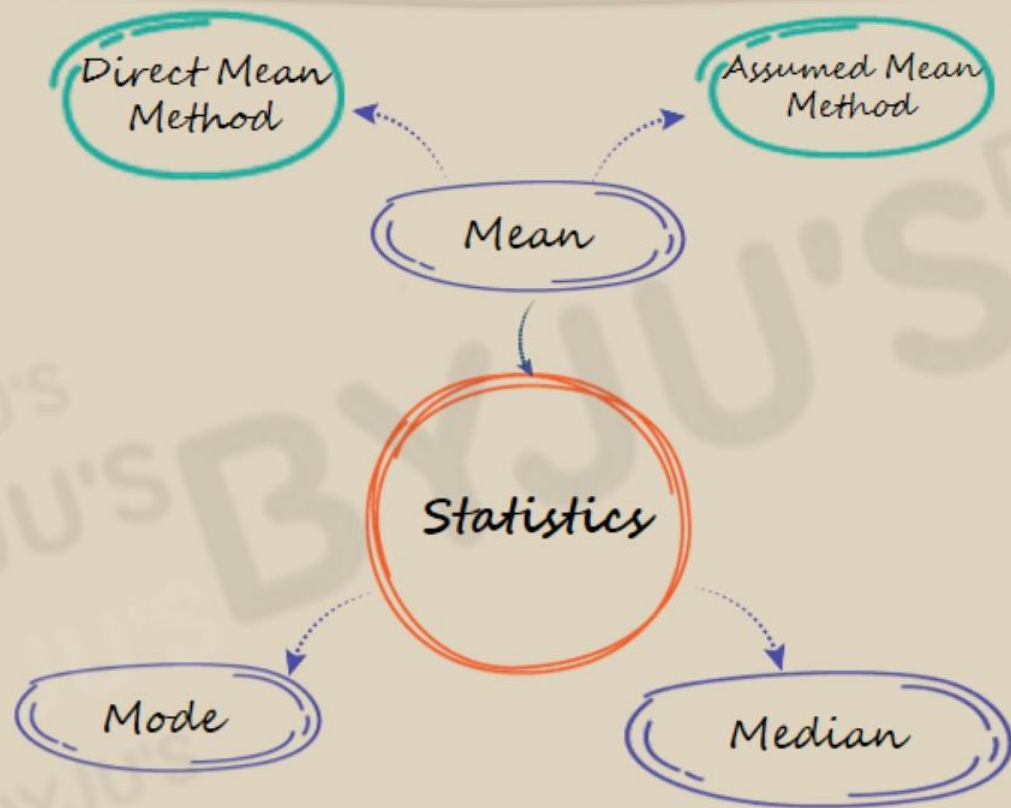

l = lower class limit of the modal class

h = class interval size

f_1 = frequency of the modal class

f_0 = frequency of the preceding class

f_2 = frequency of the succeeding class
