| 20. | (c) Assertion (A) is true but reason (R) is false. | 1 |
|  | SECTION B |  |
|  | Section B consists of 5 questions of 2 marks each. |  |
| 21. | Let us assume, to the contrary, that $\sqrt{2}$ is rational. <br> So, we can find integers $a$ and $b$ such that $\sqrt{2}=\frac{a}{b}$ where $a$ and $b$ are coprime. $\text { So, } b \sqrt{2}=\mathrm{a} \text {. }$ <br> Squaring both sides, we get $2 b^{2}=a^{2}$. <br> Therefore, 2 divides $\mathrm{a}^{2}$ and so 2 divides a. <br> So, we can write $\mathrm{a}=2 \mathrm{c}$ for some integer c . <br> Substituting for $a$, we get $2 b^{2}=4 c^{2}$, that is, $b^{2}=2 c^{2}$. <br> This means that 2 divides $\mathrm{b}^{2}$, and so 2 divides b <br> Therefore, $a$ and $b$ have at least 2 as a common factor. <br> But this contradicts the fact that a and b have no common factors other than 1. <br> This contradiction has arisen because of our incorrect assumption that $\sqrt{2}$ is rational. So, we conclude that $\sqrt{2}$ is irrational. | $1 / 2$ $1 / 2$ $1 / 2$ $1 / 2$ $1 / 2$ |
