## Exercise 1.1

1. Is zero a rational number? Can you write it in the form $p / q$ where $p$ and $q$ are integers and $q \neq 0$ ?

## Solution:

We know that a number is said to be rational if it can be written in the form $\mathrm{p} / \mathrm{q}$, where p and q are integers and q $\neq 0$.
Taking the case of ' 0 ',
Zero can be written in the form $0 / 1,0 / 2,0 / 3 \ldots$ as well as , $0 / 1,0 / 2,0 / 3$..
Since it satisfies the necessary condition, we can conclude that 0 can be written in the $\mathrm{p} / \mathrm{q}$ form, where q can either be positive or negative number.
Hence, 0 is a rational number.

## 2. Find six rational numbers between 3 and 4.

## Solution:

There are infinite rational numbers between 3 and 4 .
As we have to find 6 rational numbers between 3 and 4, we will multiply both the numbers, 3 and 4 , with $6+1=7$ (or any number greater than 6)
i.e., $3 \times(7 / 7)=21 / 7$
and, $4 \times(7 / 7)=28 / 7$. The numbers in between $21 / 7$ and $28 / 7$ will be rational and will fall between 3 and 4 .
Hence, 22/7, 23/7, 24/7, 25/7, 26/7, 27/7 are the 6 rational numbers between 3 and 4.
3. Find five rational numbers between $3 / 5$ and $4 / 5$.

## Solution:

There are infinite rational numbers between $3 / 5$ and $4 / 5$.
To find out 5 rational numbers between $3 / 5$ and $4 / 5$, we will multiply both the numbers $3 / 5$ and $4 / 5$
with $5+1=6$ (or any number greater than 5 )
i.e., $(3 / 5) \times(6 / 6)=18 / 30$
and, $(4 / 5) \times(6 / 6)=24 / 30$
The numbers in between $18 / 30$ and $24 / 30$ will be rational and will fall between $3 / 5$ and $4 / 5$.
Hence, 19/30, 20/30, 21/30, 22/30, 23/30 are the 5 rational numbers between $3 / 5$ and $4 / 5$
4. State whether the following statements are true or false. Give reasons for your answers.
(i) Every natural number is a whole number.

## Solution:

True
Natural numbers- Numbers starting from 1 to infinity (without fractions or decimals)
i.e., Natural numbers $=1,2,3,4 \ldots$

Whole numbers - Numbers starting from 0 to infinity (without fractions or decimals)
i.e., Whole numbers $=0,1,2,3 \ldots$

Or, we can say that whole numbers have all the elements of natural numbers and zero.
Every natural number is a whole number; however, every whole number is not a natural number.
(ii) Every integer is a whole number.

## Solution:

## False

Integers- Integers are set of numbers that contain positive, negative and 0 ; excluding fractional and decimal numbers.
i.e., integers $=\{\ldots-4,-3,-2,-1,0,1,2,3,4 \ldots\}$

Whole numbers- Numbers starting from 0 to infinity (without fractions or decimals)
i.e., Whole numbers= $0,1,2,3 \ldots$

Hence, we can say that integers include whole numbers as well as negative numbers.
Every whole number is an integer; however, every integer is not a whole number.

## (iii) Every rational number is a whole number.

Solution:

## False

Rational numbers- All numbers in the form $\mathrm{p} / \mathrm{q}$, where p and q are integers and $\mathrm{q} \neq 0$.
i.e., Rational numbers $=0,19 / 30,2,9 /-3,-12 / 7 \ldots$

Whole numbers- Numbers starting from 0 to infinity (without fractions or decimals)
i.e., Whole numbers= $0,1,2,3 \ldots$

Hence, we can say that integers include whole numbers as well as negative numbers.
All whole numbers are rational, however, all rational numbers are not whole numbers.

## Exercise 1.2

1. State whether the following statements are true or false. Justify your answers.
(i) Every irrational number is a real number.

## Solution:

True
Irrational Numbers - A number is said to be irrational, if it cannot be written in the $\mathrm{p} / \mathrm{q}$, where p and q are integers and $\mathrm{q} \neq 0$.
i.e., Irrational numbers $=\pi$, e, $\sqrt{ } 3,5+\sqrt{ } 2,6.23146 \ldots, 0.101001001000 \ldots$.

Real numbers - The collection of both rational and irrational numbers are known as real numbers.
i.e., Real numbers $=\sqrt{ } 2, \sqrt{ } 5, \pi, 0.102 \ldots$

Every irrational number is a real number, however, every real number is not an irrational number.
(ii) Every point on the number line is of the form $\sqrt{ } \mathrm{m}$ where m is a natural number.

## Solution:

## False

The statement is false since as per the rule, a negative number cannot be expressed as square roots.
E.g., $\sqrt{ } 9=3$ is a natural number.

But $\sqrt{ } 2=1.414$ is not a natural number.
Similarly, we know that there are negative numbers on the number line, but when we take the root of a negative number it becomes a complex number and not a natural number.
E.g., $\sqrt{ }-7=7 i$, where $i=\sqrt{ }-1$

The statement that every point on the number line is of the form $\sqrt{ } \mathrm{m}$, where m is a natural number is false.
(iii) Every real number is an irrational number.

## Solution:

## False

The statement is false. Real numbers include both irrational and rational numbers. Therefore, every real number cannot be an irrational number.

Real numbers - The collection of both rational and irrational numbers are known as real numbers.
i.e., Real numbers $=\sqrt{ } 2, \sqrt{ } 5,, 0.102 \ldots$

Irrational Numbers - A number is said to be irrational, if it cannot be written in the $\mathrm{p} / \mathrm{q}$, where p and q are integers and $\mathrm{q} \neq 0$.
i.e., Irrational numbers $=\pi, e, \sqrt{3}, 5+\sqrt{ } 2,6.23146 \ldots, 0.101001001000 \ldots$

Every irrational number is a real number, however, every real number is not irrational.
2. Are the square roots of all positive integers irrational? If not, give an example of the square root of a number that is a rational number.

## Solution:

No, the square roots of all positive integers are not irrational.
For example,
$\sqrt{ } 4=2$ is rational.
$\sqrt{9}=3$ is rational.
Hence, the square roots of positive integers 4 and 9 are not irrational. ( 2 and 3, respectively).
3. Show how $\sqrt{ } 5$ can be represented on the number line.

Solution:
Step 1: Let line AB be of 2 unit on a number line.
Step 2: At B, draw a perpendicular line BC of length 1 unit.
Step 3: Join CA
Step 4: Now, ABC is a right angled triangle. Applying Pythagoras theorem,
$\mathrm{AB}^{2}+\mathrm{BC}^{2}=\mathrm{CA}^{2}$
$2^{2}+1^{2}=\mathrm{CA}^{2}=5$
$\Rightarrow C A=\sqrt{ } 5$. Thus, $C A$ is a line of length $\sqrt{ } 5$ unit.
Step 4: Taking CA as a radius and A as a center draw an arc touching the number line. The point at which number line get intersected by arc is at $\sqrt{5}$ distance from 0 because it is a radius of the circle whose center was A .
Thus, $\sqrt{ } 5$ is represented on the number line as shown in the figure.

4. Classroom activity (Constructing the 'square root spiral') : Take a large sheet of paper and construct the 'square root spiral' in the following fashion. Start with a point $O$ and draw a line segment OP1 of unit length. Draw a line segment P1P2 perpendicular to $\mathrm{OP}_{1}$ of unit length (see Fig. 1.9). Now draw a line segment $\mathrm{P}_{2} \mathrm{P}_{3}$ perpendicular to $\mathrm{OP}_{2}$. Then draw a line segment $\mathrm{P}_{3} \mathbf{P}_{4}$ perpendicular to $\mathrm{OP}_{3}$. Continuing in Fig. 1.9 :

Fig. 1.9: Constructing

## square root spiral

Constructing this manner, you can get the line segment $\mathbf{P}_{\mathrm{n}-1} \mathbf{P n}$ by square root spiral drawing a line segment of unit length perpendicular to $\mathbf{O P}_{n-1}$. In this manner, you will have created the points $\mathbf{P}_{2}, \mathbf{P}_{3}, \ldots, \mathrm{Pn}^{\prime}, \ldots$, and joined them to create a beautiful spiral depicting $\sqrt{ } 2, \sqrt{ } 3, \sqrt{ } 4, \ldots$

Solution:

Step 1: Mark a point $O$ on the paper. Here, $O$ will be the center of the square root spiral.
Step 2: From O, draw a straight line, OA, of 1 cm horizontally.
Step 3: From A, draw a perpendicular line, AB, of 1 cm .
Step 4: Join OB. Here, OB will be of $\sqrt{ } 2$
Step 5: Now, from B, draw a perpendicular line of 1 cm and mark the end point $C$.
Step 6: Join OC. Here, OC will be of $\sqrt{ } 3$
Step 7: Repeat the steps to draw $\sqrt{ } 4, \sqrt{ } 5, \sqrt{ } 6 \ldots$

## Exercise 1.3

1. Write the following in decimal form and say what kind of decimal expansion each has :
(i) $36 / 100$

## Solution:

$=0.36$ (Terminating)
(ii) $1 / 11$

Solution:

$=0.0909 \ldots=0 . \overline{\overline{09}}$ (Non terminating and repeating)
(iii) $4 \frac{1}{8}$

Solution:
$4 \frac{1}{8}=\frac{33}{8}$

$=4.125$ (Terminating)
(iv) $3 / 13$

Solution:

$=0.230769 \ldots=0 . \overline{230769}$
(v) $2 / 11$

Solution:

$=0.181818181818 \ldots=0 . \overline{18}$ (Non terminating and repeating)
(vi) $329 / 400$

## Solution:

400 \begin{tabular}{|c}

| 0.8225 |
| :---: |
| 329 |
| 0 |
| 3290 |
| 3200 |
| 900 |
| 800 |
| 1000 |
| 800 |
| 2000 |
| 2000 |
| 0 |

\end{tabular}

$=0.8225$ (Terminating)
2. You know that $1 / 7=0.142857$. Can you predict what the decimal expansions of $2 / 7,3 / 7,4 / 7,5 / 7,6 / 7$ are, without actually doing the long division? If so, how?
[Hint: Study the remainders while finding the value of $1 / 7$ carefully.]
Solution:

$$
\begin{aligned}
& 1 / 7=0.142857 \\
& \therefore 2 \times 1 / 7=2 \times 0 . \overline{\overline{142857}}=0 . \overline{285714} \\
& 3 \times 1 / 7=3 \times 0.1 \overline{42857=} 0.4 \overline{28571} \\
& 4 \times 1 / 7=4 \times 0.1 \overline{42857=} 0.5 \overline{71428} \\
& 5 \times 1 / 7=5 \times 0.1 \overline{42857=} 0.7 \overline{\overline{14285}} \\
& 6 \times 1 / 7=6 \times 0.1 \overline{42857=} 0.8 \overline{57142}
\end{aligned}
$$

3. Express the following in the form $p / q$, where $p$ and $q$ are integers and $q 0$.
(i) $\mathbf{0 .} \overline{\mathbf{6}}$

Solution:
$0 . \overline{6}=0.666 \ldots$
Assume that $x=0.666 \ldots$
Then, $10 x=6.666 \ldots$
$10 x=6+x$
$9 x=6$
$x=2 / 3$
(ii)
$0.4 \overline{7}$

Solution:
$0.4 \overline{7}=0.4777 .$.
$=(4 / 10)+(0.777 / 10)$
Assume that $x=0.777 \ldots$
Then, $10 x=7.777 \ldots$
$10 x=7+x$
$x=7 / 9$
$(4 / 10)+(0.777 . . / 10)=(4 / 10)+(7 / 90)(x=7 / 9$ and $x=0.777 \ldots 0.777 \ldots / 10=7 /(9 \times 10)=7 / 90)$
$=(36 / 90)+(7 / 90)=43 / 90$
(iii) $0 . \overline{001}$

Solution:

$$
0 . \overline{001}=0.001001 \ldots
$$

Assume that $x=0.001001 \ldots$
Then, $1000 x=1.001001 \ldots$

$$
1000 x=1+x
$$

$$
999 x=1
$$

$x=1 / 999$
4. Express $0.99999 \ldots$... in the form $\mathrm{p} / \mathrm{q}$. Are you surprised by your answer? With your teacher and classmates discuss why the answer makes sense.

Solution:
Assume that $x=0.9999 \ldots .$. Eq (a)
Multiplying both sides by 10 ,
$10 x=9.9999 \ldots$ Eq. (b)
Eq.(b) - Eq.(a), we get
$10 x=9.9999$
$-x=-0.9999 \ldots$
$9 x=9$
$x=1$
The difference between 1 and 0.999999 is 0.000001 which is negligible.
Hence, we can conclude that, 0.999 is too much near 1 , therefore, 1 as the answer can be justified.
5. What can the maximum number of digits be in the repeating block of digits in the decimal expansion of 1/17? Perform the division to check your answer.

Solution:
1/17
Dividing 1 by 17 :

$\frac{1}{17}=0.0 \overline{\overline{588235294117647}}$
There are 16 digits in the repeating block of the decimal expansion of $1 / 17$.
6. Look at several examples of rational numbers in the form $p / q(q \neq 0)$, where $p$ and $q$ are integers with no common factors other than 1 and having terminating decimal representations (expansions). Can you guess what property $q$ must satisfy?

## Solution:

We observe that when q is $2,4,5,8,10 \ldots$ Then the decimal expansion is terminating. For example:
$1 / 2=0.5$, denominator $\mathrm{q}=2^{1}$
$7 / 8=0.875$, denominator $\mathrm{q}=2^{3}$
$4 / 5=0.8$, denominator $\mathrm{q}=5^{1}$
We can observe that the terminating decimal may be obtained in the situation where prime factorization of the denominator of the given fractions has the power of only 2 or only 5 or both.
7. Write three numbers whose decimal expansions are non-terminating non-recurring.

## Solution:

We know that all irrational numbers are non-terminating non-recurring. three numbers with decimal expansions that are non-terminating non-recurring are:

1. $\sqrt{ } 3=1.732050807568$
2. $\sqrt{ } 26=5.099019513592$
3. $\sqrt{ } 101=10.04987562112$
4. Find three different irrational numbers between the rational numbers 5/7 and 9/11.

Solution:

$$
\begin{aligned}
& \frac{5}{7}=0 . \overline{714285} \\
& \frac{9}{11}=0 . \overline{81}
\end{aligned}
$$

Three different irrational numbers are:

1. $0.73073007300073000073 \ldots$
2. $0.75075007300075000075 \ldots$
3. $0.76076007600076000076 \ldots$
4. Classify the following numbers as rational or irrational according to their type:
(i) $\sqrt{ } 23$

Solution:
$\sqrt{ } 23=4.79583152331 \ldots$
Since the number is non-terminating and non-recurring therefore, it is an irrational number.
(ii) $\sqrt{225}$

Solution:
${ }^{2} 25=15=15 / 1$
Since the number can be represented in $\mathrm{p} / \mathrm{q}$ form, it is a rational number.
(iii) 0.3796

Solution:
Since the number, 0.3796 , is terminating, it is a rational number.
(iv) 7.478478

Solution:
The number,7.478478, is non-terminating but recurring, it is a rational number.
(v) $1.101001000100001 \ldots$

Solution:
Since the number, 1.101001000100001..., is non-terminating non-repeating (non-recurring), it is an irrational number.

## Exercise 1.4

1. Visualise 3.765 on the number line, using successive magnification.

Solution:

2. Visualise $4 . \overline{26}$ on the number line, up to $\mathbf{4}$ decimal places.

## Solution:

$4 . \overline{26}=4.26262626 \ldots$.
$4 . \overline{\mathbf{2 6}}$ up to 4 decimal places $=4.2626$

## Exercise 1.5

1. Classify the following numbers as rational or irrational:
(i) $2-\sqrt{5}$

## Solution:

We know that, $\sqrt{ } 5=2.2360679 \ldots$
Here, $2.2360679 \ldots$ is non-terminating and non-recurring.
Now, substituting the value of $\sqrt{ } 5$ in $2-\sqrt{ } 5$, we get,
$2-\sqrt{ } 5=2-2.2360679 \ldots=-0.2360679$
Since the number, $-0.2360679 \ldots$, is non-terminating non-recurring, $2-\sqrt{5}$ is an irrational number.
(ii) $(3+\sqrt{ } 23)-\sqrt{ } 23$

Solution:
$(3+\sqrt{ } 23)-\sqrt{ } 23=3+\sqrt{ } 23-\sqrt{ } 23$
$=3$
$=3 / 1$
Since the number $3 / 1$ is in $\mathrm{p} / \mathrm{q}$ form, $(\mathbf{3}+\sqrt{ } \mathbf{2 3})-\sqrt{ } \mathbf{2 3}$ is rational.
(iii) $2 \sqrt{ } 7 / 7 \sqrt{ } 7$

Solution:
$2 \sqrt{7} / 7 \sqrt{ } 7=(2 / 7) \times(\sqrt{ } 7 / \sqrt{ } 7)$
We know that $(\sqrt{ } 7 / \sqrt{ } 7)=1$
Hence, $(2 / 7) \times(\sqrt{ } 7 / \sqrt{ } 7)=(2 / 7) \times 1=2 / 7$
Since the number, $2 / 7$ is in $\mathrm{p} / \mathrm{q}$ form, $2 \sqrt{ } 7 / 7 \sqrt{ } 7$ is rational.
(iv) $1 / \sqrt{ } 2$

Solution:
Multiplying and dividing numerator and denominator by $\sqrt{ } 2$ we get,
$(1 / \sqrt{ } 2) \times(\sqrt{ } 2 / \sqrt{ } 2)=\sqrt{ } 2 / 2($ since $\sqrt{ } 2 \times \sqrt{ } 2=2)$
We know that, $\sqrt{ } 2=1.4142 \ldots$
Then, $\sqrt{2} / 2=1.4142 / 2=0.7071$..
Since the number, 0.7071..is non-terminating non-recurring, $1 / \sqrt{ } 2$ is an irrational number.
(v) 2

Solution:
We know that, the value of $=3.1415$

Hence, $2=2 \times 3.1415 . .=6.2830 \ldots$
Since the number, $6.2830 \ldots$, is non-terminating non-recurring, 2 is an irrational number.
2. Simplify each of the following expressions:
(i) $(3+\sqrt{ } 3)(2+\sqrt{ } 2)$

Solution:
$(3+\sqrt{ } 3)(2+\sqrt{ } 2)$
Opening the brackets, we get, $(3 \times 2)+(3 \times \sqrt{ } 2)+(\sqrt{ } 3 \times 2)+(\sqrt{ } 3 \times \sqrt{ } 2)$
$=6+3 \sqrt{ } 2+2 \sqrt{ } 3+\sqrt{ } 6$
(ii) $(3+\sqrt{ } 3)(3-\sqrt{ } 3)$

Solution:
$(3+\sqrt{3})(3-\sqrt{3})=3^{2}-(\sqrt{ } 3)^{2}=9-3$
$=6$
(iii) $(\sqrt{ } 5+\sqrt{ } 2)^{2}$

Solution:
$(\sqrt{5}+\sqrt{ } 2)^{2}=\sqrt{ } 5^{2}+(2 \times \sqrt{ } 5 \times \sqrt{ } 2)+\sqrt{ } 2^{2}$
$=5+2 \times \sqrt{ } 10+2=7+2 \sqrt{ } 10$
(iv) $(\sqrt{ } 5-\sqrt{ } 2)(\sqrt{ } 5+\sqrt{ } 2)$

Solution:
$(\sqrt{5}-\sqrt{2})(\sqrt{5}+\sqrt{2})=\left(\sqrt{5^{2}}-\sqrt{ } 2^{2}\right)=5-2=3$
3. Recall, $\pi$ is defined as the ratio of the circumference (say c) of a circle to its diameter, (say d). That is, $\pi$ $=c / d$. This seems to contradict the fact that $\pi$ is irrational. How will you resolve this contradiction?

## Solution:

There is no contradiction. When we measure a value with a scale, we only obtain an approximate value. We never obtain an exact value. Therefore, we may not realize whether c or d is irrational. The value of $\pi$ is almost equal to 22/7 or 3.142857...
4. Represent $(\sqrt{ } 9.3)$ on the number line.

## Solution:

Step 1: Draw a 9.3 units long line segment, AB . Extend AB to C such that $\mathrm{BC}=1$ unit.
Step 2: Now, $\mathrm{AC}=10.3$ units. Let the centre of AC be O .
Step 3: Draw a semi-circle of radius OC with centre O.
Step 4: Draw a BD perpendicular to AC at point B intersecting the semicircle at D. Join OD.
Step 5: OBD, obtained, is a right angled triangle.
Here, OD 10.3/2 (radius of semi-circle), $\mathrm{OC}=10.3 / 2, \mathrm{BC}=1$
$\mathrm{OB}=\mathrm{OC}-\mathrm{BC}$
$\Rightarrow(10.3 / 2)-1=8.3 / 2$
Using Pythagoras theorem,
We get,
$\mathrm{OD}^{2}=\mathrm{BD}^{2}+\mathrm{OB}^{2}$
$\Rightarrow(10.3 / 2)^{2}=\mathrm{BD}^{2}+(8.3 / 2)^{2}$
$\Rightarrow \mathrm{BD}^{2}=(10.3 / 2)^{2}-(8.3 / 2)^{2}$
$\Rightarrow(\mathrm{BD})^{2}=(10.3 / 2)-(8.3 / 2)(10.3 / 2)+(8.3 / 2)$
$\Rightarrow \mathrm{BD}^{2}=9.3$
$\Rightarrow \mathrm{BD}=\sqrt{ } 9.3$
Thus, the length of BD is $\sqrt{ } 9.3$.
Step 6: Taking BD as radius and B as centre draw an arc which touches the line segment. The point where it touches the line segment is at a distance of $\sqrt{ } 9.3$ from O as shown in the figure.

5. Rationalize the denominators of the following:
(i) $1 / \sqrt{ } 7$

Solution:
Multiply and divide $1 / \sqrt{ } 7$ by $\sqrt{ } 7$
$(1 \times \sqrt{ } 7) /(\sqrt{ } 7 \times \sqrt{ } 7)=\sqrt{ } 7 / 7$
(ii) $1 /(\sqrt{7}-\sqrt{ } 6)$

## Solution:

Multiply and divide $1 /(\sqrt{ } 7-\sqrt{ } 6)$ by $(\sqrt{ } 7+\sqrt{6})$
$[1 /(\sqrt{7}-\sqrt{6})] \times(\sqrt{7}+\sqrt{6}) /(\sqrt{7}+\sqrt{6})=(\sqrt{7}+\sqrt{ } 6) /(\sqrt{7}-\sqrt{6})(\sqrt{7}+\sqrt{6})$
$=(\sqrt{7}+\sqrt{ } 6) / \sqrt{ } 7^{2}-\sqrt{ } 6^{2}$ [denominator is obtained by the property, $\left.(a+b)(a-b)=a^{2}-b^{2}\right]$
$=(\sqrt{7}+\sqrt{6}) /(7-6)$
$=(\sqrt{ } 7+\sqrt{ } 6) / 1$
$=\sqrt{7}+\sqrt{6}$
(iii) $1 /(\sqrt{ } 5+\sqrt{ } 2)$

Solution:
Multiply and divide $1 /(\sqrt{5}+\sqrt{2})$ by $(\sqrt{5}-\sqrt{2})$
$[1 /(\sqrt{ } 5+\sqrt{ } 2)] \times(\sqrt{ } 5-\sqrt{ } 2) /(\sqrt{ } 5-\sqrt{ } 2)=(\sqrt{5}-\sqrt{ } 2) /(\sqrt{ } 5+\sqrt{ } 2)(\sqrt{5}-\sqrt{ } 2)$
$=(\sqrt{5}-\sqrt{ } 2) /\left(\sqrt{\left.5^{2}-\sqrt{ } 2^{2}\right)}\right.$ [denominator is obtained by the property, $\left.(a+b)(a-b)=a^{2}-b^{2}\right]$
$=(\sqrt{5}-\sqrt{ } 2) /(5-2)$
$=(\sqrt{5}-\sqrt{2}) / 3$
(iv) $1 /(\sqrt{7-2})$

Solution:
Multiply and divide $1 /(\sqrt{7}-2)$ by $(\sqrt{ } 7+2)$
$1 /(\sqrt{ } 7-2) \times(\sqrt{ } 7+2) /(\sqrt{ } 7+2)=(\sqrt{ } 7+2) /(\sqrt{ } 7-2)(\sqrt{ } 7+2)$
$=(\sqrt{ } 7+2) /\left(\sqrt{ } 7^{2}-2^{2}\right)$ [denominator is obtained by the property, $\left.(a+b)(a-b)=a^{2}-b^{2}\right]$
$=(\sqrt{ } 7+2) /(7-4)$
$=(\sqrt{ } 7+2) / 3$

## Exercise 1.6

1. Find:
(i) $64^{1 / 2}$

Solution:
$64^{1 / 2}=(8 \times 8)^{1 / 2}$
$=\left(8^{2}\right)^{1 / 2}$
$=8^{1}[\because 2 \times 1 / 2=2 / 2=1]$
$=8$
(ii) $32^{1 / 5}$

Solution:
$32^{1 / 5}=\left(2^{5}\right)^{1 / 5}$
$=\left(2^{5}\right)^{1 / s}$
$=2^{1}[\because 5 \times 1 / 5=1]$
$=2$
(iii) $125^{1 / 3}$

Solution:
$(125)^{1 / 3}=(5 \times 5 \times 5)^{1 / 3}$
$=\left(5^{3}\right)^{1 / 3}$
$=5^{1}(3 \times 1 / 3=3 / 3=1)$
$=5$
2. Find:
(i) $9^{3 / 2}$

Solution:

$$
\begin{aligned}
& 9^{3 / 2}=(3 \times 3)^{3 / 2} \\
& =\left(3^{2}\right)^{3 / 2} \\
& =3^{3}[\because 2 \times 3 / 2=3] \\
& =27
\end{aligned}
$$

(ii) $32^{2 / 5}$

## Solution:

$32^{2 / 5}=(2 \times 2 \times 2 \times 2 \times 2)^{2 / 5}$
$=\left(2^{5}\right)^{25}$
$=2^{2}[\because 5 \times 2 / 5=2]$
$=4$
(iii) $16^{3 / 4}$

Solution:
$16^{3 / 4}=(2 \times 2 \times 2 \times 2)^{3 / 4}$
$=\left(2^{4}\right)^{34}$
$=2^{3}[\because 4 \times 3 / 4=3]$
$=8$
(iv) $125^{-1 / 3}$
$125^{-1 / 3}=(5 \times 5 \times 5)^{-1 / 3}$
$=\left(5^{3}\right)^{-1 / 3}$
$=5^{-1}[\because 3 \times-1 / 3=-1]$
$=1 / 5$
3. Simplify:
(i) $2^{2 / 3} \times 2^{1 / 5}$

Solution:
$2^{2 / 3} \times 2^{1 / 5}=2^{(2 / 3)+(1 / 5)}\left[\because\right.$ Since, $a^{\mathrm{m}} \times \mathrm{a}^{\mathrm{n}}=\mathrm{a}^{\mathrm{m}+\mathrm{n}}$ $\qquad$ Laws of exponents]
$=2^{13 / 15}[\because 2 / 3+1 / 5=(2 \times 5+3 \times 1) /(3 \times 5)=13 / 15]$
(ii) $\left(1 / 3^{3}\right)^{7}$

Solution:
$\left(1 / 3^{3}\right)^{7}=\left(3^{-3}\right)^{7}\left[\because\right.$ Since, $\left(\mathrm{a}^{\mathrm{m}}\right)^{\mathrm{n}}=\mathrm{a}^{\mathrm{mxn}}$ $\qquad$ Laws of exponents]
$=3^{-21}$
(iii) $11^{1 / 2} / 11^{1 / 4}$

Solution:
$11^{1 / 2 / 11^{1 / 4}}=11^{(1 / 2)-(1 / 4)}$
$\left.=11^{1 / 4}[\because(1 / 2)-(1 / 4)=(1 \times 4-2 \times 1) /(2 \times 4)=4-2) / 8=2 / 8=1 / 4\right]$
(iv) $7^{1 / 2} \times 8^{1 / 2}$

Solution:
$7^{1 / 2} \times 8^{1 / 2}=(7 \times 8)^{1 / 2}\left[\because\right.$ Since, $\left(a^{m} \times b^{m}=(a \times b)^{m}\right.$ $\qquad$ Laws of exponents]
$=56^{1 / 2}$
