

EXERCISE 3.6

1. Solve the following pairs of equations by reducing them to a pair of linear equations:

(i) $\frac{1}{2}x + \frac{1}{3}y = 2$

$\frac{1}{3}x + \frac{1}{2}y = \frac{13}{6}$

Solution:

Let us assume $\frac{1}{x} = m$ and $\frac{1}{y} = n$, then the equation will change as follows.

$\frac{m}{2} + \frac{n}{3} = 2$

$\Rightarrow 3m + 2n - 12 = 0 \dots\dots\dots(1)$

$\frac{m}{3} + \frac{n}{2} = \frac{13}{6}$

$\Rightarrow 2m + 3n - 13 = 0 \dots\dots\dots(2)$

Now, using cross-multiplication method, we get,

$\frac{m}{(-26 - (-36))} = \frac{n}{(-24 - (-39))} = \frac{1}{(9 - 4)}$

$\frac{m}{10} = \frac{n}{15} = \frac{1}{5}$

$\frac{m}{10} = \frac{1}{5}$ and $\frac{n}{15} = \frac{1}{5}$

So, $m = 2$ and $n = 3$

$\frac{1}{x} = 2$ and $\frac{1}{y} = 3$

$x = \frac{1}{2}$ and $y = \frac{1}{3}$

(ii) $2\sqrt{x} + 3\sqrt{y} = 2$

$4\sqrt{x} + 9\sqrt{y} = -1$

Solution:

Substituting $\frac{1}{\sqrt{x}} = m$ and $\frac{1}{\sqrt{y}} = n$ in the given equations, we get

$2m + 3n = 2 \dots\dots\dots(i)$

$4m - 9n = -1 \dots\dots\dots(ii)$

Multiplying equation (i) by 3, we get

$6m + 9n = 6 \dots\dots\dots(iii)$

Adding equation (ii) and (iii), we get

$10m = 5$

$m = \frac{1}{2} \dots\dots\dots(iv)$

Now by putting the value of 'm' in equation (i), we get

$2 \times \frac{1}{2} + 3n = 2$

$3n = 1$

$n = \frac{1}{3}$

$$m = 1/\sqrt{x}$$

$$\frac{1}{2} = 1/\sqrt{x}$$

$$x = 4$$

$$n = 1/\sqrt{y}$$

$$\frac{1}{3} = 1/\sqrt{y}$$

$$y = 9$$

Hence, $x = 4$ and $y = 9$

(iii) $\frac{4}{x} + 3y = 14$

$\frac{3}{x} - 4y = 23$

Solution:

Putting in the given equation we get,

So, $4m + 3y = 14 \Rightarrow 4m + 3y - 14 = 0 \dots\dots\dots(1)$

$3m - 4y = 23 \Rightarrow 3m - 4y - 23 = 0 \dots\dots\dots(2)$

By cross-multiplication, we get,

$$m/(-69-56) = y/(-42-(-92)) = 1/(-16-9)$$

$$-m/125 = y/50 = -1/25$$

$$-m/125 = -1/25 \text{ and } y/50 = -1/25$$

$$m = 5 \text{ and } b = -2$$

$$m = 1/x = 5$$

So, $x = 1/5$

$$y = -2$$

(iv) $\frac{5}{(x-1)} + \frac{1}{(y-2)} = 2$

$\frac{6}{(x-1)} - \frac{3}{(y-2)} = 1$

Solution:

Substituting $1/(x-1) = m$ and $1/(y-2) = n$ in the given equations, we get,

$5m + n = 2 \dots\dots\dots(i)$

$6m - 3n = 1 \dots\dots\dots(ii)$

Multiplying equation (i) by 3, we get

$15m + 3n = 6 \dots\dots\dots(iii)$

Adding (ii) and (iii) we get

$$21m = 7$$

$$m = 1/3$$

Putting this value in equation (i), we get

$$5 \times \frac{1}{3} + n = 2$$

$$n = 2 - \frac{5}{3} = \frac{1}{3}$$

$$m = \frac{1}{x-1}$$

$$\Rightarrow \frac{1}{3} = \frac{1}{x-1}$$

$$\Rightarrow x = 4$$

$$n = \frac{1}{y-2}$$

$$\Rightarrow \frac{1}{3} = \frac{1}{y-2}$$

$$\Rightarrow y = 5$$

Hence, $x = 4$ and $y = 5$

(v) $(7x-2y)/xy = 5$

$(8x + 7y)/xy = 15$

Solution:

$$(7x-2y)/xy = 5$$

$$7/y - 2/x = 5 \dots\dots\dots(i)$$

$$(8x + 7y)/xy = 15$$

$$8/y + 7/x = 15 \dots\dots\dots(ii)$$

Substituting $1/x = m$ in the given equation we get,

$$-2m + 7n = 5 \Rightarrow -2 + 7n - 5 = 0 \dots\dots(iii)$$

$$7m + 8n = 15 \Rightarrow 7m + 8n - 15 = 0 \dots\dots(iv)$$

By cross-multiplication method, we get,

$$m/(-105 - (-40)) = n/(-35 - 30) = 1/(-16 - 49)$$

$$m/(-65) = n/(-65) = 1/(-65)$$

$$m/-65 = 1/-65$$

$$m = 1$$

$$n/(-65) = 1/(-65)$$

$$n = 1$$

$$m = 1 \text{ and } n = 1$$

$$m = 1/x = 1 \quad n = 1/y = 1$$

Therefore, $x = 1$ and $y = 1$

(vi) $6x + 3y = 6xy$

$2x + 4y = 5xy$

Solution:

$6x + 3y = 6xy$

$$6/y + 3/x = 6$$

Let $1/x = m$ and $1/y = n$

$$\Rightarrow 6n + 3m = 6$$

$$\Rightarrow 3m + 6n - 6 = 0 \dots\dots\dots(i)$$

$$2x + 4y = 5xy$$

$$\Rightarrow 2/y + 4/x = 5$$

$$\Rightarrow 2n + 4m = 5$$

$$\Rightarrow 4m + 2n - 5 = 0 \dots\dots\dots(ii)$$

$$3m + 6n - 6 = 0$$

$$4m + 2n - 5 = 0$$

By cross-multiplication method, we get

$$m/(-30 - (-12)) = n/(-24 - (-15)) = 1/(6-24)$$

$$m/-18 = n/-9 = 1/-18$$

$$m/-18 = 1/-18$$

$$m = 1$$

$$n/-9 = 1/-18$$

$$n = 1/2$$

$$m = 1 \text{ and } n = 1/2$$

$$m = 1/x = 1 \text{ and } n = 1/y = 1/2$$

$$x = 1 \text{ and } y = 2$$

Hence, $x = 1$ and $y = 2$

(vii) $10/(x+y) + 2/(x-y) = 4$

$15/(x+y) - 5/(x-y) = -2$

Solution:

Substituting $1/x+y = m$ and $1/x-y = n$ in the given equations, we get,

$$10m + 2n = 4 \Rightarrow 10m + 2n - 4 = 0 \dots\dots\dots(i)$$

$$15m - 5n = -2 \Rightarrow 15m - 5n + 2 = 0 \dots\dots\dots(ii)$$

Using cross-multiplication method, we get,

$$m/(4-20) = n/(-60-(20)) = 1/(-50 -30)$$

$$m/-16 = n/-80 = 1/-80$$

$$m/-16 = 1/-80 \text{ and } n/-80 = 1/-80$$

$$m = 1/5 \text{ and } n = 1$$

$$m = 1/(x+y) = 1/5$$

$$x+y = 5 \dots\dots\dots(iii)$$

$$n = 1/(x-y) = 1$$

$$x-y = 1 \dots\dots\dots(iv)$$

Adding equation (iii) and (iv), we get

$$2x = 6 \Rightarrow x = 3 \dots\dots(v)$$

Putting the value of $x = 3$ in equation (3), we get

$$y = 2$$

Hence, $x = 3$ and $y = 2$

$$(viii) \frac{1}{(3x+y)} + \frac{1}{(3x-y)} = \frac{3}{4}$$

$$\frac{1}{2(3x+y)} - \frac{1}{2(3x-y)} = -\frac{1}{8}$$

Solution:

Substituting $1/(3x+y) = m$ and $1/(3x-y) = n$ in the given equations, we get,

$$m + n = 3/4 \dots\dots\dots(1)$$

$$m/2 - n/2 = -1/8$$

$$m - n = -1/4 \dots\dots\dots(2)$$

Adding (1) and (2), we get

$$2m = 3/4 - 1/4$$

$$2m = 1/2$$

Putting in (2), we get

$$1/4 - n = -1/4$$

$$n = 1/4 + 1/4 = 1/2$$

$$m = 1/(3x+y) = 1/4$$

$$3x + y = 4 \dots\dots\dots(3)$$

$$n = 1/(3x-y) = 1/2$$

$$3x - y = 2 \dots\dots\dots(4)$$

Adding equations (3) and (4), we get

$$6x = 6$$

$$x = 1 \dots\dots\dots(5)$$

Putting in (3), we get

$$3(1) + y = 4$$

$$y = 1$$

Hence, $x = 1$ and $y = 1$

2. Formulate the following problems as a pair of equations, and hence find their solutions:

(i) Ritu can row downstream 20 km in 2 hours, and upstream 4 km in 2 hours. Find her speed of rowing in still water and the speed of the current.

(ii) 2 women and 5 men can together finish an embroidery work in 4 days, while 3 women and 6 men can finish it in 3 days. Find the time taken by 1 woman alone to finish the work, and also that taken by 1 man alone.

(iii) Roohi travels 300 km to her home partly by train and partly by bus. She takes 4 hours if she travels 60 km by train and the remaining by bus. If she travels 100 km by train and the remaining by bus, she takes 10 minutes longer. Find the speed of the train and the bus separately.

Solutions:

(i) Let us consider,

Speed of Ritu in still water = x km/hr

Speed of Stream = y km/hr

Now, speed of Ritu during,

Downstream = $x + y$ km/h

Upstream = $x - y$ km/h

As per the question given,

$$2(x+y) = 20$$

$$\text{Or } x + y = 10 \dots\dots\dots(1)$$

$$\text{And, } 2(x-y) = 4$$

$$\text{Or } x - y = 2 \dots\dots\dots(2)$$

Adding both the eq.1 and 2, we get,

$$2x = 12$$

$$x = 6$$

Putting the value of x in eq.1, we get,

$$y = 4$$

Therefore,

Speed of Ritu rowing in still water = 6 km/hr

Speed of Stream = 4 km/hr

(ii) Let us consider,

Number of days taken by women to finish the work = x

Number of days taken by men to finish the work = y

Work done by women in one day = $1/x$

Work done by men in one day = $1/y$

As per the question given,

$$4(2/x + 5/y) = 1$$

$$(2/x + 5/y) = 1/4$$

And, $3(3/x + 6/y) = 1$

$$(3/x + 6/y) = 1/3$$

Now, put $1/x=m$ and $1/y=n$, we get,

$$2m + 5n = 1/4 \Rightarrow 8m + 20n = 1 \dots\dots\dots(1)$$

$$3m + 6n = 1/3 \Rightarrow 9m + 18n = 1 \dots\dots\dots(2)$$

Now, by cross multiplication method, we get here,

$$m/(20-18) = n/(9-8) = 1/(180-144)$$

$$m/2 = n/1 = 1/36$$

$$m/2 = 1/36$$

$$m = 1/18$$

$$m = 1/x = 1/18$$

or $x = 18$

$$n = 1/y = 1/36$$

$$y = 36$$

Therefore,

Number of days taken by women to finish the work = 18

Number of days taken by men to finish the work = 36.

(iii) Let us consider,

Speed of the train = x km/h

Speed of the bus = y km/h

According to the given question,

$$60/x + 240/y = 4 \dots\dots\dots(1)$$

$$100/x + 200/y = 25/6 \dots\dots\dots(2)$$

Put $1/x=m$ and $1/y=n$, in the above two equations;

$$60m + 240n = 4 \dots\dots\dots(3)$$

$$100m + 200n = 25/6$$

$$600m + 1200n = 25 \dots\dots\dots(4)$$

Multiply eq.3 by 10, to get,

$$600m + 2400n = 40 \dots\dots\dots(5)$$

Now, subtract eq.4 from 5, to get,

$$1200n = 15$$

$$n = 15/1200 = 1/80$$

Substitute the value of n in eq. 3, to get,

$$60m + 3 = 4$$

$$m = 1/60$$

$$m = 1/x = 1/60$$

$$x = 60$$

And $y = 1/n$

$$y = 80$$

Therefore,

Speed of the train = 60 km/h

Speed of the bus = 80 km/h
