

Q 3.1:

Arrange the following metals in the order in which they displace each other from the solution of their salts. Al, Cu, Fe, Mg and Zn.

Answer:

According to their reactivity, the given metals replace the others from their salt solutions in the said order: Mg, Al, Zn, Fe, and Cu.

Mg: Al: Zn: Fe: Cu

Q 3.2:

Given the standard electrode potentials. $K^+/K = -2.93V$

 $Ag^{+}/Ag = 0.80V$

 $Hg^{2+}/Hg = 0.79V$

 $Mg^{2+}/Mg = -2.37 V$

 $Cr^{3+}/Cr = -0.74V$ Arrange these metals in their increasing order of reducing power.

Ans:

The reducing power increases with the lowering of the reduction potential. In order of given standard electrode potential (increasing order): $K^+/K < Mg^{2+}/Mg < Cr^{3+}/Cr < Hg^{2+}/Hg < Ag^+/Ag$

Thus, in the order of reducing power, we can arrange the given metals as Ag < Hg < Cr < Mg < K

Q 3.3 :

Depict the galvanic cell in which the reaction $Zn(s) + 2Ag^{+}(aq) \rightarrow Zn^{2+}(aq) + 2Ag(s)$ takes place. Further show: (i) Which of the electrode is negatively charged? (ii) The carriers of the current in the cell. (iii) Individual reaction at each electrode.

Ans :

The galvanic cell in which the given reaction takes place is depicted as

 $Zn_{(s)}|Zn^{2+}_{(aq)}||Ag^{+}_{(aq)}|Ag_{(s)}|$

(i) The negatively charged electrode is the Zn electrode (anode).

(ii) The current carriers in the cell are ions. Current flows to zinc from silver in the external circuit.

(iii) Reaction at the anode is given by

$$Zn_{(s)}
ightarrow Zn^{2+}_{(aq)} + 2e^-$$

Reaction at the anode is given by

$$Ag^+_{(aq)} + e^-
ightarrow Ag_{(s)}$$

Q 3.4:

Calculate the standard cell potentials of the galvanic cell in which the following reactions take place.

(i) $2Cr(s) + 3Cd^{2+}(aq) \rightarrow 2Cr^{3+}(aq) + 3Cd$ (ii) $Fe^{2+}(aq) + Ag^{+}(aq) \rightarrow Fe^{3+}(aq) + Ag(s)$ Calculate the ΔrGJ and equilibrium constant of the reactions.

Ans :

(i)

$$E^{\Theta}_{Cr^{3+}/Cr}$$

= 0.74 V

$$E^{\Theta}_{Cd^{2+}/Cd}$$

= -0.40 V

The galvanic cell of the given reaction is depicted as

$$Cr_{(s)}|Cr_{(aq)}^{3+}||Cd_{aq}^{2+}|Cd_{(s)}|$$

Now, the standard cell potential is

$$E_{cell}^{\Theta} = E_g^{\Theta} - E_L^{\Theta}$$

=-0.40-(-0.74)

In the given equation, n = 6

 $F = 96487 \text{ C mol}^{-1}$

 E_{cell}^{Θ} = + 0.34 V Then,

 $\Delta_{\mathbf{r}} G^{\Theta} = -6 \times 96487 \text{ C mol}^{-1} \times 0.34 \text{ V}$ $= -196833.48 \text{ CV mol}^{-1}$

= -196833.48 J mol-1

= -196.83 kJ mol - 1

Again,

$$\begin{split} \Delta_r G^{\Theta} &= -RTlnK\\ \Delta_r G^{\Theta} &= -2.303RTlnK\\ logk &= \frac{\Delta_r G}{2.303RT}\\ &= \frac{-196.83 \times 10^3}{2.303 \times 8.314 \times 298} \end{split}$$

= 34.496

K = antilog $(34.496) = 3.13 \times 10^{34}$

The galvanic cell of the given reaction is depicted as

$$Fe^{2+}_{(aq)}|Fe^{3+}_{(aq)}||Ag^+_{(aq)}|Ag_{(s)}$$

Now, the standard cell potential is

$$E_{cell}^{\Theta} = E_g^{\Theta} - E_L^{\Theta}$$

Here, n = 1

Then,

$$\Delta_t G^0 = -nFE^0_{cell}$$

 $= -1 \times 96487 \text{ C mol}^{-1} \times 0.03 \text{ V}$

 $= -2894.61 \text{ J mol}^{-1}$

 $= -2.89 \text{ kJ mol}^{-1}$

Again,

$$\begin{array}{l} \Delta_t G^0 = -2.303 RT \ lnK \\ lnK = \frac{\Delta_t G}{2.303 RT} \\ = \frac{-2894.61}{2.303 \times 8.314 \times 298} \end{array}$$

= 0.5073

K = antilog (0.5073)

= 3.2 (approximately)

Q 3.5:

 $\begin{array}{l} Write the Nernst equation and emf of the following cells at 298 K. \\ (i) Mg(s)|Mg^{2+}(0.001M)||Cu^{2+}(0.0001 M)|Cu(s) \\ (ii) Fe(s)|Fe^{2+}(0.001M)||H^{+}(1M)|H2(g)(1bar)| Pt(s) \\ (iii) Sn(s)|Sn^{2+}(0.050 M)||H^{+}(0.020 M)|H2(g) (1 bar)|Pt(s) \\ (iv) Pt(s)|Br-(0.010 M)|Br_2(1)||H^{+}(0.030 M)| H_2(g) (1 bar)|Pt(s) \\ \end{array}$

Answer

(i) For the given reaction, the Nernst equation can be given as

$$\begin{split} E_{cell} &= E_{cell}^0 - \frac{0.591}{n} \log \frac{[Mg^{2+}]}{[Cu^{2+}]} \\ &= 0.34 - (-2.36) - \frac{0.0591}{2} \log \frac{0.001}{0.0001} \\ 2.7 - \frac{0.0591}{2} \log 10 \end{split}$$

= 2.7 - 0.02955

= 2.67 V (approximately)

(ii) For the given reaction, the Nernst equation can be given as

$$E_{cell} = E_{cell}^{0} - \frac{0.591}{n} \log \frac{[Fe^{2+}]}{[H^+]^2}$$

= 0 - (- 0.14) -
$$\frac{0.0591}{n} \log \frac{0.050}{(0.020)^2}$$

= 0.52865 V

= 0.53 V (approximately)

(iii) For the given reaction, the Nernst equation can be given as

$$E_{cell} = E_{cell}^{0} - \frac{0.591}{n} \log \frac{[Fe^{2+}]}{[H^+]^2}$$

= 0 - (- 0.14) -
$$\frac{0.0591}{n} \log \frac{0.050}{(0.020)^2}$$

= 0.14 - 0.062

= 0.08 V (approximately)

(iv) For the given reaction, the Nernst equation can be given as

$$E_{cell} = E_{cell}^{0} - \frac{0.591}{n} \log \frac{1}{[Br-]^2[H^+]^2}$$

= 0 - 1.09 -
$$\frac{0.591}{2} \log \frac{1}{(0.010)^2(0.030)^2}$$

= -1.09 - 0.02955 x
$$\log \frac{1}{0.00000009}$$

= -1.09 - 0.02955 x
$$\log \frac{1}{9 \times 10^{-8}}$$

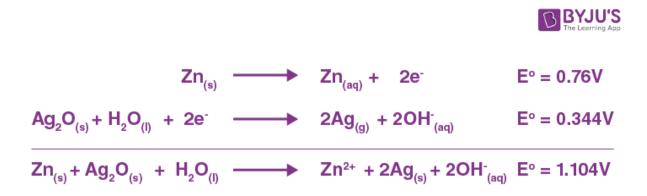

= -1.09 - 0.02955 x
$$\log(1.11 \times 10^7)$$

= -1.09 - 0.02955 x (0.0453 + 7)
= -1.09 - 0.208
= -1.298 V

Q 3.6:

In the button cells widely used in watches and other devices, the following reaction takes place:

Determine $\Delta_{\!\rm r}$ GJ and EJ for the reaction.

Ans:

 E^{0} = 1.104 V We know that,

$$\Delta_r G^\Theta = -nFE^\Theta$$

 $= -2 \times 96487 \times 1.04$

= -213043.296 J

= -213.04 kJ

Q 3.7:

Define conductivity and molar conductivity for the solution of an electrolyte. Discuss their variation with concentration.

Answer

The conductivity of a solution is defined as the conductance of a solution of 1 cm in length and area of cross-section 1 sq. cm. Specific conductance is the inverse of resistivity, and it is represented by the symbol κ . If ρ is resistivity, then

we can write
$$k = \frac{1}{\rho}$$
. At any given concentration, the conductivity of a solution is defined as the unit volume of solution kept between two platinum electrodes with the unit area of the cross-section at a distance of unit length.

$$G = k \frac{a}{l} = k \times 1 = k$$
 [Since a = 1, l = 1]

BYJU'S

When concentration decreases, there will be a decrease in Conductivity. It is applicable for both weak and strong electrolytes. This is because the number of ions per unit volume that carry the current in a solution decreases with a decrease in concentration.

Molar conductivity -

The molar conductivity of a solution at a given concentration is the conductance of volume V of a solution containing 1 mole of the electrolyte, kept between two electrodes with the area of cross-section A and distance of unit length.

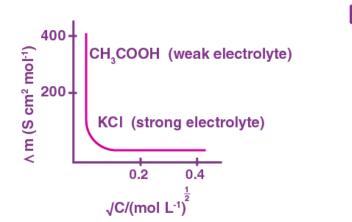

$$\Lambda_m = k \frac{A}{l}$$

Now, l = 1 and A = V (volume containing 1 mole of the electrolyte)

$$\Lambda_m = kV$$

Molar conductivity increases with a decrease in concentration. This is because the total volume V of the solution containing one mole of the electrolyte increases on dilution. The variation of

Q 3.8:

The conductivity of the 0.20 M solution of KCl at 298 K is 0.0248 S cm⁻¹. Calculate its molar conductivity.

Ans :

```
Given, \kappa = 0.0248 \text{ S cm}^{-1} \text{ c}
```

c = 0.20 M

Molar conductivity,

$$\begin{array}{l} \Lambda_m = \frac{k \times 1000}{c} \\ = \frac{0.0248 \times 1000}{0.2} \end{array}$$

 $= 124 \text{ Scm}^2 \text{mol}^{-1}$

Q 3.9:

The resistance of a conductivity cell containing 0.001M KCl solution at 298 K is 1500 Ω . What is the cell constant if the conductivity of 0.001M KCl solution at 298 K is 0.146 \times 10⁻³ S cm⁻¹

Answer

Given,

Conductivity, $k = 0.146 \times 10^{-3} \text{ S cm} - 1$

Resistance, $R = 1500 \Omega$

Cell constant = $k \times R$

 $= 0.146 \times 10^{-3} \times 1500$

 $= 0.219 \text{ cm}^{-1}$

Q 3.10:

The conductivity of sodium chloride at 298 K has been determined at different concentrations, and the results are given below.

Concentration/M	0.001	0.010	0.020	0.050	0.100
$10^{2} \times k/S m^{-1}$	1.237	11.85	23.15	55.53	106.74

Calculate Am for all concentrations and draw a plot between Am and $c^{1/2}$. Find the value of 0 A m.

Ans:

Given,

$$\kappa = 1.237 \times 10^{-2} \text{ S m} - 1, c = 0.001 \text{ M}$$

Then, $\kappa = 1.237 \times 10^{\text{--4}} \mbox{ S cm}^{\text{--1}}, \mbox{ } c^{\text{1/2}} = 0.0316 \mbox{ } M^{\text{1/2}}$

$$\begin{split} \Lambda_m &= \frac{k}{c} \\ &= \frac{1.237 \times 10^{-4} S \ cm^{-1}}{0.001 \ mol \ L^{-1}} \times \frac{1000 \ cm^{-1}}{L} \\ &= 123.7 \ \text{S} \ \text{cm}^2 \ \text{mol}^{-1} \end{split}$$

Given,

 $\kappa = 11.85 \times 10^{-2} \text{ S m}^{-1}, c = 0.010 \text{ M}$

Then, $\kappa = 11.85 \times 10^{\text{--4}} \mbox{ S cm}^{\text{--1}}, \mbox{ } c^{\text{1/2}} = 0.1 \mbox{ } M^{\text{1/2}}$

$$\begin{split} \Lambda_m &= \frac{k}{c} \\ &= \frac{11.85 \times 10^{-4} S \ cm^{-1}}{0.010 \ mol \ L^{-1}} \times \frac{1000 \ cm^{-1}}{L} \\ &= 118.5 \ \text{S} \ \text{cm}^2 \ \text{mol}^{-1} \end{split}$$

Given,

 $\kappa = 23.15 \times 10^{-2} \text{ S m}^{-1}, c = 0.020 \text{ M}$

Then, $\kappa = 23.15 \times 10^{\text{--4}} \ S \ cm^{\text{--1}}, \ c^{\text{1/2}} = 0.1414 \ M^{\text{1/2}}$

$$\begin{split} \Lambda_m &= \frac{k}{c} \\ &= \frac{23.15 \times 10^{-4} S \ cm^{-1}}{0.020 \ mol} \times \frac{1000 \ cm^{-1}}{L} \\ &= 115.8 \ S \ cm^2 \ mol^{-1} \end{split}$$

Given,

$$\kappa = 55.53 \times 10^{-2} \text{ S m}^{-1}, c = 0.050 \text{ M}$$

Then, $\kappa = 55.53 \times 10^{\text{--4}} \ S \ cm^{\text{--1}}, \ c^{\text{1/2}} = 0.2236 \ M^{\text{1/2}}$

$$\begin{split} \Lambda_m &= \frac{k}{c} \\ &= \frac{106.74 \times 10^{-4} S \ cm^{-1}}{0.050 \ mol \ L^{-1}} \times \frac{1000 \ cm^{-1}}{L} \\ &= 111.1 \ 1 \ S \ cm^2 \ mol^{-1} \end{split}$$

Given,

$$\kappa = 106.74 \times 10^{-2} \text{ S m}^{-1}, c = 0.100 \text{ M}$$

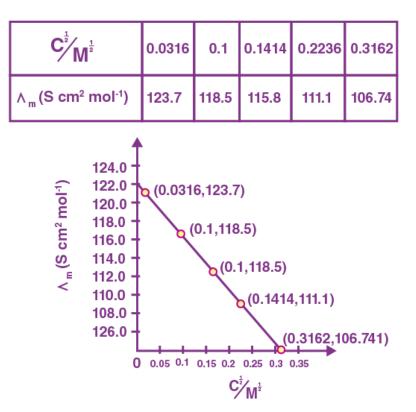

Then, $\kappa = 106.74 \times 10^{\text{-4}}$ S cm^-1, $c^{\scriptscriptstyle 1/2} = 0.3162~M^{\scriptscriptstyle 1/2}$

$$\begin{split} \Lambda_m &= \frac{k}{c} \\ &= \frac{106.74 \times 10^{-4} S \ cm^{-1}}{0.050 \ mol \ L^{-1}} \times \frac{1000 \ cm^{-1}}{L} \\ &= 111.1 \ 1 \ S \ cm^2 \ mol^{-1} \end{split}$$

Now, we have the following data:

Since the line interrupts

 $Λ_m$ at 124.0 S cm² mol⁻¹, $Λ_m^0$ = 124.0 S cm² mol⁻¹

Q 3.11:

The conductivity of 0.00241 M acetic acid is 7.896×10^{-5} S cm⁻¹. Calculate its molar conductivity. If 0 A m for acetic acid is 390.5 S cm² mol⁻¹, what is its dissociation constant?

Ans:

Given, $\kappa = 7.896 \times 10^{\text{-5}} \mbox{ S} \ m^{\text{-1}} \ c$

 $= 0.00241 \text{ mol } L^{-1}$

Then, molar conductivity,

$$\Lambda_m = \frac{k}{c}$$

Ξ

$$rac{7.896 imes 10^{-5} Scm^{-1}}{0.00241 \ mol \ L^{-1}} imes rac{1000 cm^3}{L}$$

 $= 32.76S \text{ cm}^2 \text{ mol}^{-1}$

$$\mathbf{\Lambda}_{\boldsymbol{m}}^{\boldsymbol{0}} = 390.5 \text{ S cm}^2 \text{ mol}^{-1}$$
Again,

 $lpha = rac{\Lambda_m}{\Lambda_m^0}$ =

 $= \frac{32.76 \ S \ cm^2 \ mol^{-1}}{390.5 \ S \ cm^2 \ mol^{-1}}$

Now,

= 0.084

Dissociation constant,

$$K_a = \frac{c\alpha^2}{(1-\alpha)}$$

 Ξ

$$\frac{(0.00241 \ mol \ L^{-1})(0.084)^2}{(1-0.084)}$$

 $= 1.86 \times 10^{-5} \text{ mol } L^{-1}$

Q 3.12:

How much charge is required for the following reductions? (i) 1 mol of Al^{3+} to Al(ii) 1 mol of Cu^{2+} to Cu(iii) 1 mol of MnO_4^- to Mn^{2+}

Ans :

(i)

$$Al^{3+} + 3e^- \rightarrow Al$$

Required charge = 3 F

 $= 3 \times 96487 \text{ C}$

= 289461 C

(ii)

$$Cu^{2+} + 2e^-
ightarrow Cu$$

Required charge = 2 F

 $= 2 \times 96487 \text{ C}$

= 192974 C

(iii)

$$MnO_4^- \rightarrow Mn^{2+}$$

i.e

$$Mn^{7+} + 5e^- \rightarrow Mn^{2+}$$

Required charge = 5 F

= 5 × 96487 C

= 482435 C

Q 3.13:

How much electricity in terms of Faraday is required to produce (i) 20.0 g of Ca from molten CaCl₂? (ii) 40.0 g of Al from molten Al₂O₃?

Ans:

(i) From the given data,

$$Ca^{2+} + 2e^- \rightarrow Ca$$

Electricity required to produce 40 g of calcium = 2 F

Therefore, electricity required to produce 20 g of calcium = $(2 \times 20)/40$ F

(ii) From the given data,

 $Al^{3+} + 3e^- \rightarrow Al$

Electricity required to produce 27 g of Al = 3 F

Therefore, electricity required to produce 40 g of A1 = $(3 \times 40)/27$ F

= 4.44 F

Q 3.14:

How much electricity is required in coulomb for the oxidation of (i) 1 mol of H₂O to O₂? (ii) 1 mol of FeO to Fe₂O₃?

Ans :

(i) From the given data,

$$H_2O
ightarrow H_2 + rac{1}{2}O_2$$

We can say that

$$O^{2-}
ightarrow rac{1}{2}O_2+2e^-$$

Electricity required for the oxidation of 1 mol of H_2O to $O_2 = 2 \text{ F}$

= 2 × 96487 C

= 192974 C

(ii) From the given data,

 $2+\rightarrow 2+\rightarrow 3++2-$ Electricity required for the oxidation of 1 mol of FeO to Fe₂O₃ = 1 F

= 96487 C

Q 3.15:

A solution of Ni(NO₃)₂ is electrolysed between platinum electrodes using a current of 5 amperes for 20 minutes. What mass of Ni is deposited at the cathode?

Ans :

Given,

Current = 5A

Time = $20 \times 60 = 1200$ s

Charge = current \times time

 $= 5 \times 1200$

= 6000 C

According to the reaction,

$$Ni^{2+} + 2e^- \rightarrow Ni_{(s)} + e^-$$

Nickel deposited by 2×96487 C = 58.71 g

Therefore, nickel deposited by 6000 C =

 $\frac{58.71 \times 6000}{2 \times 96487} g$

= 1.825 g

Hence, 1.825 g of nickel will be deposited at the cathode.

Q 3.16:

Three electrolytic cells, A, B, and C, containing solutions of ZnSO₄, AgNO₃ and CuSO₄, respectively, are connected in series. A steady current of 1.5 amperes was passed through them until 1.45 g of silver was deposited at the cathode of cell B. How long did the current flow? What mass of copper and zinc were deposited?

Ans :

According to the reaction,

$$Ag^+_{(aq)} + e^-
ightarrow Ag_{(s)}$$

i.e., 108 g of Ag is deposited by 96487 C.

Therefore, 1.45 g of Ag is deposited by =

 $\frac{96487 \times 1.45}{107}C$

= 1295.43 C

Given,

Current = 1.5 A

Time = 1295.43/ 1.5 s

= 863.6 s

= 864 s

= 14.40 min

Again,

$$Cu^{2+}_{(aq)} + 2e^-
ightarrow Cu_{(s)}$$

i.e., 2×96487 C of charge deposit = 63.5 g of Cu

Therefore, 1295.43 C of charge will deposit

$$\frac{63.5 \times 1295.43}{2 \times 96487}$$

= 0.426 g of Cu

$$Zn^{2+}_{(aq)} + 2e^- \rightarrow Zn_{(s)}$$

i.e., 2 × 96487 C of charge deposit = 65.4 g of Zn

Therefore, 1295.43 C of charge will deposit

 $\frac{65.4 \times 1295.43}{2 \times 96487}$

= 0.439 g of Zn

Using the standard electrode potentials given in Table 3.1, predict if the reaction between the following is feasible.

(i) $Fe^{_{3+}}(aq)$ and $I^-(aq)$ (ii) $Ag^{_+}(aq)$ and Cu(s) (iii) $Fe^{_{3+}}(aq)$ and $Br^-(aq)$

 $\begin{array}{l} (iv) \ Ag(s) \ and \ Fe \ {}^{_{3+}}(aq) \\ (v) \ Br_2 \ (aq) \ and \ Fe \ {}^{_{2+}}(aq) \end{array}$

Ans :

(i)

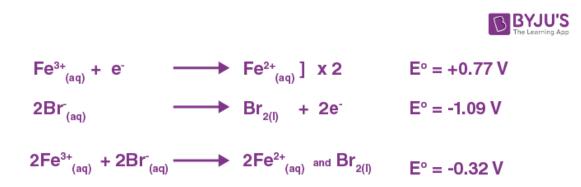

(ii)

 E^{0} is positive; hence, the reaction is feasible.

(iii)

 E^{0} is negative; hence, the reaction is not feasible.

 $Ag_{(s)} + e^{-} \longrightarrow Ag_{(aq)}^{+} + e^{-} \qquad E^{\circ} = -0.80V$ $Fe^{3+}_{(aq)} + e^{-} \longrightarrow Fe^{2+}_{(aq)} \qquad E^{\circ} = +0.77V$ $Ag_{(s)} + Fe^{3+}_{(aq)} \longrightarrow Ag_{(aq)}^{+} + Fe^{2+}_{(aq)} \qquad E^{\circ} = -0.03V$

 E^{0} is negative; hence, the reaction is not feasible.

(v)

(iv)

 E^{0} is positive; hence, the reaction is feasible.

Q 3.18:

Predict the products of electrolysis in each of the following. (i) An aqueous solution of AgNO₃ with silver electrodes (ii) An aqueous solution of AgNO₃ with platinum electrodes (iii) A dilute solution of H₂SO₄ with platinum electrodes (iv) An aqueous solution of CuCl₂ with platinum electrodes

Ans:

(i) At the cathode,

The following reduction reactions compete to take place at the cathode.

$$egin{aligned} &Ag^+_{(aq)} + e^- o Ag_{(s)}\ &F^0 = 0.80 \ V\ &H^+_{(aq)} + e^- o rac{1}{2} H_{2(g)}\ &F^0 = 0.00 \ V \end{aligned}$$

The reaction with a higher value of E^{0} takes place at the cathode. Therefore, the deposition of silver will take place at the cathode.

At the anode,

form Ag⁺.

$$NO_3^+$$

ions. Therefore, the silver electrode at the anode dissolves in the solution to

(ii) At the cathode,

The Ag anode is attacked by

The following reduction reactions compete to take place at the cathode.

$$egin{aligned} &Ag^+_{(aq)} + e^- o Ag_{(s)}\ &; { extsf{E}}^0 = 0.80 \ { extsf{V}}\ &H^+_{(aq)} + e^- o rac{1}{2} H_{2(g)}\ &; { extsf{E}}^0 = 0.00 \ { extsf{V}} \end{aligned}$$

The reaction with a higher value of E^0 takes place at the cathode. Therefore, the deposition of silver will take place at the cathode.

At the anode,

Since Pt electrodes are inert, the anode is not attacked by NO_3^+ ions. Therefore, OH⁻ or NO_3^+ ions can be oxidised at the anode. But OH⁻ ions have a lower discharge potential and get preference and decompose to liberate O₂.

$$OH^-
ightarrow OH + E^- \ 4OH^-
ightarrow 2H_2O + O_2$$

(iii) At the cathode, the following reduction reaction occurs to produce H₂ gas.

$$H^+_{(aq)}+e^-
ightarrowrac{1}{2}H_{2(g)}$$

At the anode, the following processes are possible.

$$\begin{array}{l} 2H_2O_{(l)}\rightarrow O_{2(g)}+4H^+_{(aq)}+4e^-\\ ;\, {\rm E}^0=+1.23\,{\rm V} \qquad --({\rm i})\\ 2SO^{2-}_{4(aq)}\rightarrow S_2O^{2-}_{6(aq)}+2e^-\\ ;\, {\rm E}^0=+1.96\,{\rm V} \qquad --({\rm i}{\rm i}) \end{array}$$

For dilute sulphuric acid, reaction (i) is preferred to produce O_2 gas. But for concentrated sulphuric acid, reaction (ii) occurs.

(iv) At the cathode,

The following reduction reactions compete to take place at the cathode.

$$Cu^{2+}_{(aq)} + 2e^- \rightarrow Cu_{(s)}$$

; E⁰ = 0.34 V
 $H^+_{(aq)} + e^- \rightarrow \frac{1}{2}H_{2(g)}$
; E⁰ = 0.00 V

The reaction with a higher value takes place at the cathode. Therefore, the deposition of copper will take place at the cathode.

At the anode,

The following oxidation reactions are possible at the anode.

$$\begin{array}{l} Cl^-_{(aq)} \to \frac{1}{2} Cl_{2(g)} + e^- \\ ; {\rm E}^0 = 1.36 \ {\rm V} \\ 2H_2 0_{(l)} \to O_{2(g)} + 4H^+_{(aq)} + e^- \\ ; {\rm E}^0 = +1.23 \ {\rm V} \end{array}$$

At the anode, the reaction with a lower value of E^0 is preferred. But due to the overpotential of oxygen, Cl^- gets oxidised at the anode to produce Cl_2 gas.
