Triangles

Topics

1. Similar Triangles
2. Criteria of Similarity of Triangles
3. Pythagoras Theorem

4. Basic Proportionality Theorem

SAS

SSS

$a^2 + b^2 = c^2$

AAA

Similar Triangles

Similar Triangles → Same Shape

Similar Triangles → Different or Same size

Relation between Corresponding Sides and Angles

⭐ Two triangles are similar, if

⭐ Their corresponding angles are equal.

$\angle A = \angle P$

$\angle B = \angle Q$

$\angle C = \angle R$
⭐ Their corresponding sides are in the same ratio.

$$\frac{AB}{PQ} = \frac{BC}{QR} = \frac{CA}{RP} = k$$
Criteria for Similarity of Triangles

Side-Side-Side (SSS)

⭐ Corresponding sides are proportional.

$$\frac{AB}{PQ} = \frac{BC}{QR} = \frac{CA}{RP}$$

Angle-Angle-Angle (AAA) / Angle-Angle (AA)

⭐ Corresponding angles are equal.

⭐ Triangles are similar even if a pair of corresponding angles are equal.
Side-Angle-Side (SAS)

⭐ Pair of adjacent corresponding sides are proportional and one angle is equal.

$$\frac{AB}{PQ} = \frac{BC}{QR} = \frac{2}{3}$$

$$\angle B = \angle Q$$

Ratio of Areas of Similar Triangles

Ratio of Area of Similar Triangles

$$\frac{\text{Area}(\Delta ABC)}{\text{Area}(\Delta PQR)} = \left(\frac{AB}{PQ}\right)^2 = \left(\frac{BC}{QR}\right)^2 = \left(\frac{CA}{RP}\right)^2$$
Properties of Right-Angled Triangles

Similarity of triangles when a perpendicular is drawn from the vertex of the right angle.

$\Delta ABC \sim \Delta ADC \sim \Delta ADB$ (AA Similarity)

All the three triangles have:
- ★ A right-angle.
- ★ A common angle.

Basic Proportionality Theorem

> If a line is drawn parallel to one side of a triangle to intersect the other two sides in distinct points, then the other two sides are divided in the same ratio.

Proof:

Area of $\Delta APQ = \frac{1}{2} \times AP \times QN$

Area of $\Delta PBQ = \frac{1}{2} \times PB \times QN$

Area of $\Delta APQ = \frac{1}{2} \times AQ \times PM$

Area of $\Delta QCP = \frac{1}{2} \times QC \times PM$

Now,

$$\frac{\text{Area of } \Delta APQ}{\text{Area of } \Delta PBQ} = \frac{\frac{1}{2} \times AP \times QN}{\frac{1}{2} \times PB \times QN} = \frac{AP}{PB} \quad \ldots\ldots\ldots(1)$$
Similarly,

$$\frac{\text{Area of } \Delta APQ}{\text{Area of } \Delta QCP} = \frac{\frac{1}{2} \times AQ \times PM}{\frac{1}{2} \times QC \times PM} = \frac{AQ}{QC} \quad \ldots\ldots(2)$$

The triangles drawn between the same parallel lines and on the same base have equal areas.

$\therefore$ Area of $\Delta PBQ =$ Area of ΔQCP $\ldots\ldots\ldots(3)$

From (1), (2) and (3)

$$\boxed{\frac{AP}{PB} = \frac{AQ}{QC}}$$

Converse of Basic Proportionality Theorem

> If a line divides any two sides of a triangle in the same ratio, then the line is parallel to the third side.

Proof:

If $\dfrac{AD}{DB} = \dfrac{AE}{EC}$, then DE || BC.

Suppose a line DE, intersects the two sides of a triangle AB and AC at D and E, such that:

$$\frac{AD}{DB} = \frac{AE}{EC} \quad \dots\dots(1)$$

Assume DE is not parallel to BC. Now, draw a line DE' parallel to BC.

Hence, by Basic Proportionality Theorem,

$$\frac{AD}{DB} = \frac{AE'}{E'C} \dots\dots(2)$$

From eq. 1 and 2, we get

$$\frac{AE}{EC} = \frac{AE'}{E'C}$$
Adding 1 on both the sides

$$\frac{AE}{EC} + 1 = \frac{AE'}{E'C} + 1 \implies \frac{AE+EC}{EC} = \frac{AE'+E'C}{E'C}$$

$$\frac{AC}{EC} = \frac{AC}{E'C} \implies \text{So, } EC = E'C$$

This is possible only when E and E' coincides.

But DE' || BC

$\therefore$ DE || BC.

# Properties of Right-Angled Triangles

Pythagoras Theorem

In a right-angled triangle, the square of the hypotenuse side is equal to the sum of squares of the other two sides.

Proof:

$\triangle ADB \sim \triangle ABC$

$\therefore \dfrac{AD}{AB} = \dfrac{AB}{AC}$ (corresponding sides of similar triangles)

$AB^2 = AD \times AC$ ....(1)

Also, $\triangle ADC \sim \triangle ABC$

$\therefore \dfrac{CD}{BC} = \dfrac{BC}{AC}$ (corresponding sides of similar triangles)

$BC^2 = CD \times AC$ ....(2)

(1) + (2)

$AB^2 + BC^2 = AD \times AC + CD \times AC$

$AB^2 + BC^2 = AC (AD + CD)$

Since, $AD + CD = AC$

$\therefore AC^2 = AB^2 + BC^2$

Converse of Pythagoras Theorem

> **!** If the square of the length of the longest side of a triangle is equal to the sum of the squares of the other two sides, then the triangle is a right triangle.

Proof:

Construct another triangle, $\triangle EGF$, such as $AC = EG$ and $BC = FG$.

In $\triangle EGF$, by Pythagoras Theorem:

$$EF^2 = EG^2 + FG^2 = b^2 + a^2 \quad ......(1)$$

In $\triangle ABC$, by Pythagoras Theorem:

$$AB^2 = AC^2 + BC^2 = b^2 + a^2 \quad ......(2)$$

From (1) and (2)
$EF^2 = AB^2$

$EF = AB$

$\Rightarrow \triangle ACB \cong \triangle EGF$ (By SSS)
$\Rightarrow \angle C$ is right angle
$\therefore \triangle ABC$ is a right triangle.

SAS	

## Pythagoras Theorem

★ In a right-angled triangle, the square of the hypotenuse side is equal to the sum of squares of the other two sides.
$$a^2 + b^2 = c^2$$

Basic Proportionality Theorem

★ If a line is drawn parallel to one side of a triangle to intersect the other two sides in distinct points, then the other two sides are divided in the same ratio.

$$PQ \parallel BC, \quad \frac{AP}{PB} = \frac{AQ}{QC}$$
